This report concerns a study which was conducted for SKB. The conclusions and viewpoints presented in the report are those of the authors and do not necessarily coincide with those of the client.

Data in SKB's database can be changed for different reasons. Minor changes in SKB's database will not necessarily result in a revised report. Data revisions may also be presented as supplements, available at [www\(skb.se\)](http://www(skb.se)).

A pdf version of this document can be downloaded from [www\(skb.se\)](http://www(skb.se)).

## **Abstract**

A two years and four months long comprehensive chemical investigation campaign of surface waters in the Forsmark area commenced in March 2002 and was completed in June 2004. This was followed by a less extensive long-term monitoring programme which was initiated in July 2004. This report, the fifth in the present series, comprises documentation of the field-work as well as compilation and tabulation of surface water data obtained during the period July 2006–June 2007, i.e. the third year of the monitoring programme.

The sampling during the third year continued from the same eleven sampling objects and at unchanged frequency, once per month. The sampling continued also from the extra sampling object (Lake Biotestsjön) that was included in order to check possible tritium contamination from the nuclear power plant. The sampling focuses on streams, lakes, a shallow sea bay and a deep sea water location in Öregrundsgrepen in order to characterise the surface waters of the area. The results obtained included field measurements of ORP (Oxidising-Reducing Potential), pH, dissolved oxygen, electrical conductivity, salinity, barometric pressure, turbidity, chlorophyll, light penetration, PAR (Photosynthetic Active Radiation) and water temperature as well as chemical analyses of major constituents, nutrient salts, carbon species, trace metals and isotopes.

Three of the samples collected close to the cooling water outlet from the nuclear power plant (Lake Biotestsjön) showed somewhat elevated tritium contents. However, no unnaturally high values were observed from the regular sampling locations for sea water.

Fresh waters in the Forsmark area are well buffered with high alkalinity, high pH and high calcium concentrations. Furthermore, waters recently affected by brackish sea water show high sodium chloride concentrations and there is a clear relationship between the movement/alteration of the coastline and the salinity of the water samples collected at the sampling locations in the area. Generally, the new data confirm the knowledge and conclusions presented in previous reports from earlier investigation periods.

## **Sammanfattning**

En omfattande kemisk undersökningskampanj på två år och fyra månader rörande ytvatten i Forsmarksområdet startade i mars 2002 och avslutades i juni 2004. Det åtföljdes av ett reducerat program för långtidsövervakning som påbörjades i juli 2004. Denna rapport, den femte i ordningen, innehåller dokumentation av fältarbetet samt presentation och sammanställning av erhållna data under perioden juli 2006 till och med juni 2007, det vill säga det tredje året av övervakningsprogrammet.

Provtagningen under tredje året fortsatte från samma elva provpunkter och med oförändrad provtagningsfrekvens, en gång per månad. Dock inkluderades en extra provpunkt (Biotestsjön) för att kontrollera eventuell kontaminering av tritium från kärnkraftverket. Provtagningen skedde i vattendrag, sjöar, en grund havsvik och en djuphavspunkt i Öregrundsgrepen för att karakterisera ytvattnen i området. De erhållna resultaten omfattar fältmätningar av ORP (Oxidising-Reducing Potential), pH, löst syre, elektrisk konduktivitet, salinitet, barometertyck, turbiditet, klorofyll, sikt djup, PAR (Photosynthetic Active Radiation) och vattentemperatur samt kemiska analyser av huvudkomponenter, närsalter, kolföreningar, spårelement och isotoper.

Tre av proven som togs ut nära kylvattenutsläppet från kärnkraftverket (Biotestsjön) visade något förhöjda tritiumvärden. Inga onaturligt höga värden kunde dock observeras från den ordinarie provpunkten för havsvatten.

Sötvattnen i Forsmarksområdet är väl buffrade med hög alkalinitet, högt pH och höga kalcium-koncentrationer. Vidare visar vatten som nyligen påverkats av bräckt havsvatten höga salthalter och det finns ett klart samband mellan kustlinjens förändring och saliniteten hos prov tagna i olika provpunkter i området. De nya data som erhållits bekräftar i huvudsak de kunskaper och slutsatser som presenterats i föregående rapporter från tidigare undersökningsperioder.

# 1 Introduction

This document reports the performance and results from the activity *Long-term monitoring of surface waters* performed within the site investigation at Forsmark /1/. The work was conducted according to the activity plan and method documentations listed in Table 1-1 and is part of both the hydrochemistry and the surface ecosystem investigation programmes. Both activity plan and method descriptions are SKB's internal controlling documents. The report treats the third year of the long-term surface water monitoring programme (July 2006–June 2007). Four previous reports present results from earlier investigations periods, /2, 3, 4 and 5/.

Original data from the reported activity are stored in the primary database Sicada. Data are traceable in Sicada by the activity plan number (AP PF 400-06-064). Only data in databases are accepted for further interpretation and modelling. The data presented in this report are regarded as copies of the original data. Data in the database may be revised, if needed. However, such revision of the database will not necessarily result in a revision of this report.

The surface water activities include sampling, chemical analyses and field measurements. The sampling objects consist of lake waters, stream waters and sea waters from shallow bays in the Forsmark area. The sampling locations are presented in Figure 3-1.

Water sampling and measurement procedures are also described in SKB PIR-04-09 “Metodik för provtagning av ekologiska parametrar i hav”, SKB PIR-04-06, “Metodik för provtagning av ekologiska parametrar i sjöar och vattendrag”, and SKB PIR-04-12, ”Översikt över provhanterings- och analysrutiner för vattenprov” (SKB internal documents).

## **2 Objectives and scope**

The ongoing surface water monitoring programme which started in July 2004, concentrates on sampling locations in the prioritised northwestern part of the Forsmark candidate area /6/ and aims at creating long-term series of data. The main objectives are to obtain further information on natural variations and also to allow identification of eventual perturbation effects from the ongoing investigations. The sampling locations are presented in Figure 3-1.

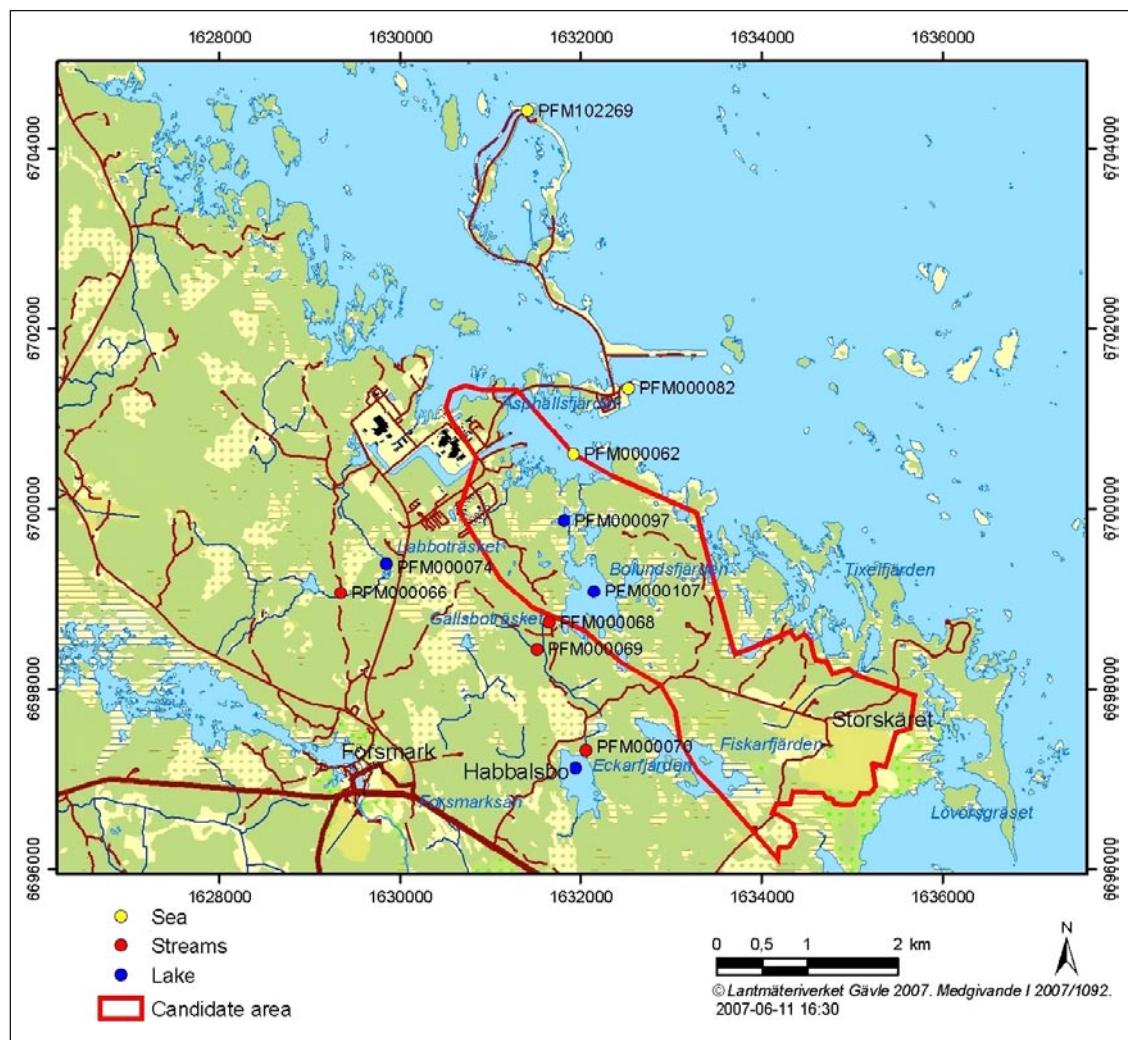

The monitoring programme includes water sampling and sonde measurements in the different lake systems; Lake Bolundsfjärden, Lake Eckarfjärden and Lake Labboträsket. Measurements are being performed also in Lake Norra Bassängen in order to monitor salinity changes. One regular sampling location represents a shallow sea bay (Forslingens grund). Besides the regular sampling locations, additional sampling was conducted for the second time by another contractor at a deep sea water location in Öregrundsgrepen. The first sampling occasion occurred in August 2004 /4/. Sampling of stream water is conducted at four localities (Kungsträsket, Bolundsskogen, Norr Eckarfjärden, Öster Gunnarsbo) and an electrical conductivity logger is installed in Lilleputtsundet, also to monitor salinity changes. Furthermore, due to observed enhanced tritium contents in the surface waters close to the nuclear power plant, samples for tritium analyses are collected close to the cooling water outlet in Lake Biötestsjön.

The monitoring programme included water sampling for chemical analysis as well as direct measurements of physical and chemical parameters such as ORP (Oxidising Reducing Potential), pH, dissolved oxygen, electrical conductivity, salinity, barometric pressure, turbidity, chlorophyll, light penetration, PAR (Photosynthetic Active Radiation) and water temperature. The extent of the sampling varied at different occasions. Analyses of major constituents and surface water supplements (nutrient salts, chlorophyll etc) were conducted frequently (12 times a year) while extended analyses including also isotopes and trace elements were performed once per season (four times a year). Some special isotopes ( $\delta^{37}\text{Cl}$ ,  $\delta^{13}\text{C}$ ,  $^{14}\text{C}$  (pmC),  $^{87}\text{Sr}/^{86}\text{Sr}$ ,  $\delta^{34}\text{S}$ , U- and Th-isotopes as well as Ra- and Rn-isotopes) were determined only once a year, in July.

### 3 Sampling locations and sampling scheme

The monitoring programme, which started in July 2004, includes four lakes, one shallow sea bay location and four streams as well as a sampling location close to the outlet of cooling water from the nuclear power plant to investigate eventual tritium contamination. Furthermore, a deep sea location was sampled at one occasion during the reported period by another contractor.

The sampling locations are presented in Figure 3-1. Table 3-1 lists the id-codes, coordinates and names together with clarifying comments. The sampling scheme for the period July 2006–June 2007 is given in Table 3-2.

**Figure 3-1.** Sampling locations within the monitoring programme. One location constitutes an alternative for a regular sampling position (see Table 3-1). The deep sea water location in Öregrundsgrepen is not on the map, see /4/.

## 4 Equipment

### 4.1 Sampling equipment

Water samples were collected using an online pumping setup consisting of an electrical peristaltic pump system, PPS (ASF Thomas SR 10/100, powered by 12 VDC, 7 Ah cells), connected to 4–8 m long teflon-tubes (FEP 140) of 5 mm inner diameter. A manually operated regulator (ELFA, DCM 24–40 pwm) was used to adjust the water flow to a maximum of 1.3–2.9 litres/minute (depending on tube length, tube diameter and pumping level). The sampling equipment is presented in Figure 4-1.

### 4.2 Multiparameter sondes

Field measurements were performed using two multiparameter sondes (YSI 6600 EDS and YSI 600 QS). A terminal (YSI 650 MDS) is connected to each sonde through a cable for logging data (Figure 4-2). Calibration of the sondes was carried out according to the measurement system description SKB MD 910.003 (SKB internal controlling document, see Table 1-1).

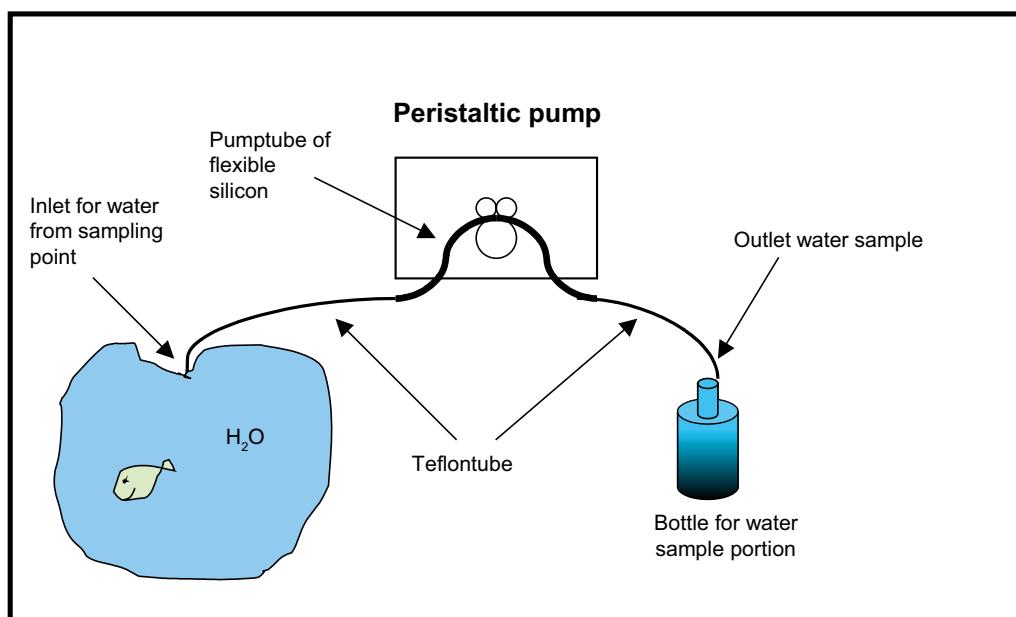

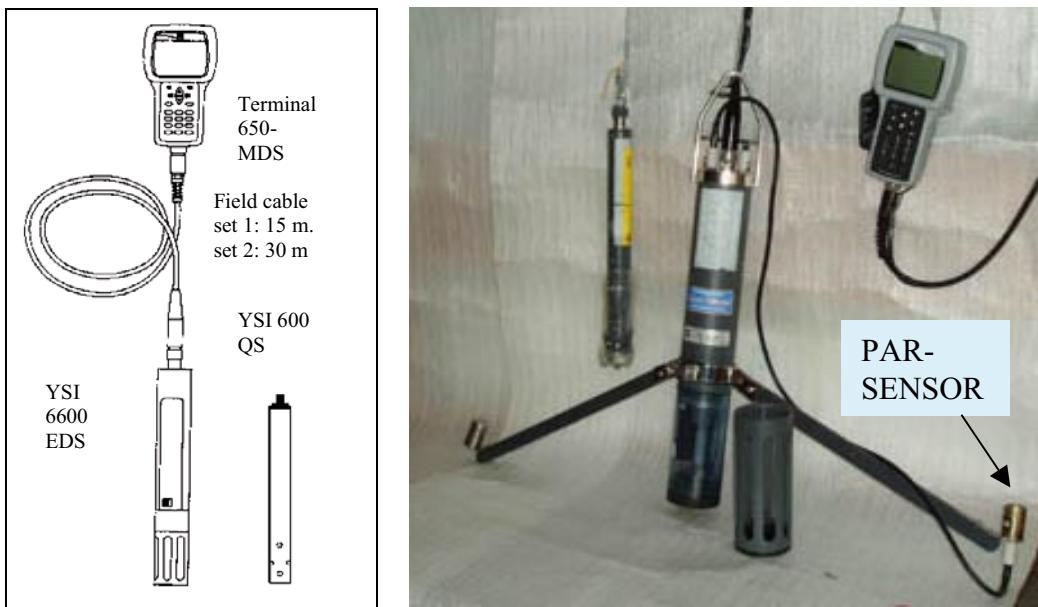

Figure 4-1. Schematic presentation of the peristaltic pump system (PPS).

**Figure 4-2.** Measurement sondes used in the field investigations.

**Table 4-1. Parameters measured by the two different YSI sondes.**

Parameter	YSI 6600 EDS	YSI 600 QS
Date/time	Yes	Yes
Temperature (°C)	Yes	Yes
pH	Yes	Yes
Dissolved oxygen (mg/L)	Yes	Yes
ORP (Redox potential, mV)	Yes	Yes
Electrical conductivity (mS/cm)	Yes	Yes
Salinity (ppt)	Yes	Yes
Depth (m)	Yes	Yes
Barometric pressure (mm Hg)	Yes	Yes
Turbidity (NTU)	Yes	No
Chlorophyll ( $\mu\text{g/l}$ )	Yes	No
Light/PAR* ( $\mu\text{moles s}^{-1} \text{m}^{-2}$ )	Yes	No

\* Photosynthetic Active Radiation

### 4.3 General field equipment

- Ruttner samplers were used as back up if the portable pump system should fail.
- The exact locations of the sampling positions were found using a GPS (Garmin 172C) with an average accuracy of  $\pm 0.5\text{--}1.0$  m.
- Water depth was measured using an echo sounder (Plastimo, Echotest, LCD digital sounder) with an accuracy of  $\pm 0.05$  m.
- Water transparency was estimated using a Secchi disc and aqua scope.
- Disposable filters (Millipore,  $0.40\ \mu\text{m}$ ,  $\varnothing = 22\ \text{mm}$ ) were used together with 60 mL syringes to filter specific sample portions of the sampled water in the field.
- Stopwatch (GUL), a water-filled plastic bottle (50 mL) and measuring-tape (Hultafors) were used for flow/runoff estimates in stream waters.
- Digital cameras (Nikon Coolpix 5000 and Olympus 400 mju) were used for documentation of stream waters.

*Figure 4-3. Sampling from the ice at Lake Bolundsfjärden.*

## 5 Performance

### 5.1 Presampling preparations

Prior to sampling, the sample bottles were cleaned (according to the routines for respective SKB class), labelled and packed in insulated boxes/bags. Acid additions were made in advance in bottles intended for trace metal analyses; these were placed in separate plastic bags to avoid contamination. The peristaltic pump system (PPS), including the Teflon tubes, was washed using acid (0.5 M HCl) and rinsed with deionised water before use. The equipment was kept well protected in plastic bags or in tight containers. The Disposable filters (Millipore) were rinsed with MilliQ-water (50 mL) and placed in plastic bags to prevent contamination. Calibration of the sondes was performed according to the measurement system description SKB MD 910.003.

### 5.2 Water sampling

Water samples were collected using a peristaltic pump system, PPS, and Ruttner samplers were used as backup if the PPS-system should fail. Lake and sea water samples were collected close to the surface (at 0.5 m depth) and in winter time also from approximately 0.5 m above the lake or sea bottom in case of ice coverage. Stream water samples were collected at approximately 0.1 m depth. The PPS-system and sample bottles were rinsed initially with water from the sampling locations prior to filling, except for bottles with acid additions. To avoid contamination, the field crew was obliged to wear rubber gloves and great care was taken not to contaminate bottles or equipment. Bottles and samples containing added acid were handled and stored separately to avoid contaminating other sample portions.

Each sample consists of several sample portions and is labelled with the same sample number. The preparation of the sample portions in the field differs depending on their eventual use. Details on collected sample portions, components to be analysed and sample preparations are summarised in Table 5-1.

### 5.3 Field measurements

The multiparameter sondes were used for measurements of pH, water temperature, barometric pressure, ORP, PAR, turbidity, electrical conductivity, salinity, dissolved oxygen and chlorophyll. Light penetration was measured in lakes and at the regular sea location (Forslingens grund) with a secchi disc according to the Swedish standard BIN SR 111. Photo documentation of stream waters was performed to facilitate evaluation of the investigation data. Photos were taken of each marked out (using a wooden stake) stream water sampling location.

In stream waters measurements were performed using a YSI 6600 EDS sonde if the water level was high enough, otherwise the smaller YSI 600 QS sonde was used. Chlorophyll, PAR and turbidity data were not reported for streams.

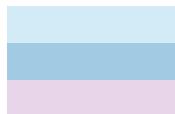

At lake and sea localities the multiple sonde (YSI 6600 EDS) was used to measure a profile at each sampling point. Measurements were conducted at every metre from the surface to the bottom, see Table 5-2. In addition, PAR was logged just below the surface and during the ice season above the ice, in the air. PAR measurements were performed at discrete depths and as continuous PAR-profile loggings. PAR-profiles were obtained by setting the sonde mode to ‘continuous logging’. The sonde was then submerged from surface to bottom and hoisted up again. The produced PAR-data were used for regression analyses of PAR versus depth.

**Table 5-1. Filled bottles, components to be analysed and preparation of samples in the field.**

Class 3: frequent

Class 5: four times per year (each season)

Class 5+: once a year (July)

Bottle volume (mL)	Number of bottles	SKB-Label	Components	Preparation of sample in field	Filling instructions
125	1	Green	Na, K, Ca, Mg, Li, Sr, S, Si, Br, I	–	Fill up
5,000 (Collecting bottle)	1	Green	Chlorophyll a, c, Pheopigment, Alkalinity, pH, Conductivity, Tot-N, Tot-P, POP, PON, POC, Anions (Br, SO <sub>4</sub> , Cl, F, I), TOC, DOC, DIC (only for control)	–	Fill up
25	2	Green	Ammonia, NO <sub>x</sub> , Silicate	Filtering with syringe/0.40 µm filter	Fill to mark
50	1	Green	TOC	–	Leave 1cm
50	2	Green	DIC/DOC	Filtering with syringe/0.40 µm filter	Leave 1cm
Winkler bottles <sup>1)</sup>	2	Green	Oxygen	1 mL Mn(II) reagent + 2 mL alkaline iodine reagent and mix	Flow over 3 x
Winkler bottles <sup>2)</sup>	2	Green	H <sub>2</sub> S <sup>2</sup>	1 mL ZnAc + 1 mL 1M NaOH and mix	Flow over x 3
100	1	Red	Trace metals	–	Fill up
500 <sup>2</sup>	1	Red	Fe(II)/Fetot <sup>2</sup>	Filtering with syringe/0.40 µm filter	Fill up
500	1	Green	Tritium	–	Flow over x 1
100	1	Green	Deuterium, O-18	–	Fill up from bottom
1,000	1	Green	<sup>34</sup> S	–	Fill up
100	1	Green	<sup>37</sup> Cl	–	Fill up
100	1	Green	<sup>87</sup> Sr/ <sup>86</sup> Sr	–	Fill up
100	1	Green	U- and Th- isotopes	–	Fill up
500	1	Green	Ra- and Rn- isotopes	–	Fill up

1) Winkler samples only when sonde measurements of oxygen show values below 4 mg/L.

2) Included in the comprehensive surface water campaign and only at reduced groundwater conditions.

**Figure 5-1.** Measuring a profile (PFM000064) in the ice covered Baltic Sea with the multiple sonde (YSI 6600 EDS).

**Table 5-2. Logging depths at sampling locations in lakes and shallow sea bays.**

Sampling locations	Name	Sonde logging depth (m)										
		0.5	1.0	1.5	2.0	2.5	3.0	4.0	4.5	5.0	6.0	6.5

PFM000082	Alternative to PFM00062	X	X		X		X	X		X	X	X

A simple “floating bottle” method was used to measure water flow/runoff in the streams as a complement to the regular method using discharge weirs and gauges. The cross-section mean area of the stream was estimated, forming a rectangle, see Figure 5-2. The time for the bottle (close to neutral in weight in water) to float the distance (L) from point A to B was measured with a stopwatch. This procedure was repeated three times in each stream. The average water velocity (m/s) multiplied with the average area ( $m^2$ ) resulted in a rough water runoff estimate ( $m^3/s$ ).

**Figure 5-2.** Schematic presentation for estimating water runoff in natural stream waters (see text for explanation).

## 5.4 Sample treatment and chemical analyses

An overview of sample treatment and analytical methods is given in Appendix 1. The routines are applicable independently of sampling method or type of sampling object.

## 5.5 Data handling/post processing

Two field protocols (activity log and sampling protocol) contain meta data (id-code, date, time, sample no., field crew etc), a few measured data and weather observations as well as comments on field conditions which may influence the analytical results. The field protocols supply basic information for creating activities and activity comments in the SKB Sicada database. In addition, the few measured parameters and weather conditions, noted on the sampling protocol, are stored as data tables in Sicada.

Furthermore, eventual deviations from the sampling programme, if any, or from the normal routines are also documented in special reports/comment files. The comment files are stored in the Sicada file archive, see Table 5-3.

### 5.5.1 Chemical analytical data

The following routines for quality control and data management are generally applied for hydrochemical analysis data, independently of sampling method or type of sampling object.

Several components are determined by more than one method and/or laboratory. Moreover, duplicate analyses by an independent laboratory are performed as a standard procedure on each fifth or tenth collected sample. All analytical results are stored in the Sicada database. The applied hierarchy path “Hydrochemistry/Hydrochemical investigation/Analyses/Water in the database” contains two types of tables, raw data tables and primary data tables (final data tables).

Data on *basic water analyses* are inserted into the raw data tables for further evaluation. The evaluation results in a final reduced data set for each sample. These data sets are compiled in a primary data table named “water composition”. The evaluation is based on:

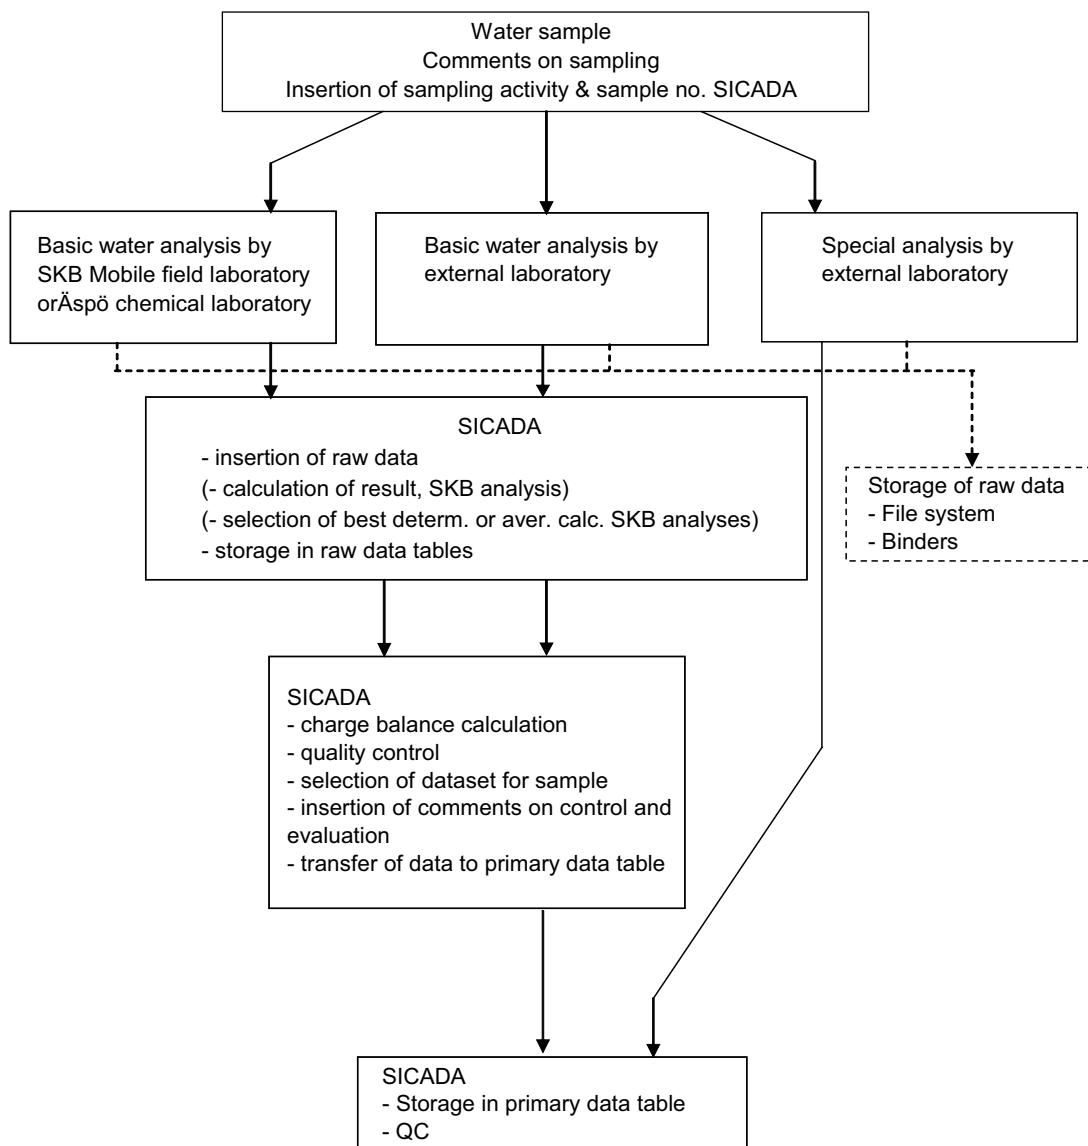

- Comparison of the results from different laboratories and/or methods. The analyses are repeated if a large disparity is noted (generally more than 10%).
- Calculation of charge balance errors according to the equation below. Relative errors within  $\pm 10\%$  are considered acceptable in surface waters.

$$\text{Relative error (\%)} = 100 \times \frac{\sum \text{cations (equivalents)} - \sum \text{anions (equivalents)}}{\sum \text{cations (equivalents)} + \sum \text{anions (equivalents)}}$$

- General expert judgement of plausibility based on earlier results and experience.

All results from *special analyses of trace metals and isotopes* are inserted directly into primary data tables. In those cases where the analyses are repeated or performed by more than one laboratory, a “best choice” notation will indicate those results which are considered most reliable.

An overview of the data management is given in Figure 5-3.

**Figure 5-3.** Overview of data management for analytical data.

## 5.5.2 Field measurement data

The logged data from sonde measurements are exported digitally from the YSI Terminal 650-MDS to the specified Sicada data table. The original raw data file, calibration file and calibration protocol from each sonde, as well as photographs and comments on sampling and measurements, are stored in the Sicada file archive, see Table 5-3.

## 5.5.3 Other relevant information and data

Information about weather conditions and related parameters during the sampling occasions are compiled in a separate table in Sicada called “Weather\_data” which contains the following columns:

Air temperature	Wind velocity	Runoff/Water flow (streams)
Cloudiness	Wind direction	Water depth
Precipitation	Light penetration (lakes and sea)	Snow/ice depth

These data are not presented in this report.

## 5.6 Nonconformities

The only nonconformities that occurred during the reported sampling period involve omitted sampling locations due to, for example, problems with ice. The reasons for deviations from the programme are compiled in Tables 5-4 and 5-5.

**Table 5-3. File types stored in the Sicada file archive.**

Type of file	Example of file name	No. per sampling session

Explanations and abbreviations:

X: Sample taken

\* Only tritium, deuterium and  $^{18}\text{O}$  samples

B: No sample, only field measurements with sonde

\*\* Only tritium and anions samples

C: No sample, due to weak ice

\*\*\* Only oxygen sample due to measured low oxygen value

E: No sample, dry conditions, or too little water to collect a representative sample

Explanations to codes/abbreviations:

F: No flow estimation.

G: Sample and sonde measurements at another depth, due to low water level or rich vegetation.

H: Stagnant water or nearly stagnant water – no flow estimation, flow approx 0 m<sup>3</sup>/s.

J: Incorrect PAR-values in one or several depths (mainly caused by waves, clouds, vegetation or darkness).

S: Peristaltic pump system was out of order, sample taken with Rutner-sampler.

U: Incorrect sond-data logged, noted in fieldprotocol.

V: No values for PAR, Turbidity and Chlorophyll, due to sonde malfunction.

Q: Risk for incorrect sonde values for PAR, Turbidity and Chlorophyll, due to plants and/or particles in the water.

Z: Winkler samples (2) collected, due to low oxygen level.

**Figure 5-3.** Stream sampling location PFM0069 with and without water.

**Figure 5-4.** Stream sampling location PFM0070 at springtime and during summer.

## **6 Results**

### **6.1 General**

The surface water investigation period from July 2006 to June 2007 includes records of 105 water analyses (i.e. number of analysed samples) and records of 300 field measurements. Furthermore, the accompanying field documentation is quite extensive. The data are compiled in the attached Appendices and stored in the Sicada database where they are traceable by the activity plan number.

Fresh waters in the Forsmark area are well buffered with high alkalinity, high pH and high calcium concentrations. In addition, waters recently affected by brackish sea water still show high sodium chloride concentrations. The relationship between the position of the coastline and the salinity of the water samples collected at the sampling locations in the area has been demonstrated in /3/. Furthermore, a detailed evaluation of surface water data from March 2002 to March 2004 was presented in /7/.

The results presented and compiled in this report are restricted to field work performed from July 2006. Besides results from the regular sampling objects, thirteen new tritium results have been obtained from the additional sampling object (outlet of cooling water into Lake Biotestsjön) and contamination problems from the nuclear power plant are further confirmed.

### **6.2 Water analyses**

#### **6.2.1 Major components**

The basic water analyses include the major constituents Na, K, Ca, Mg, Sr, S,  $\text{SO}_4^{2-}$ ,  $\text{Cl}^-$ , Si and  $\text{HCO}_3^-$  as well as the minor constituents Fe, Li, Mn, Br,  $\text{F}^-$ , I and  $\text{HS}^-$ . Furthermore, batch measurements of pH and electrical conductivity are included. The basic water analysis data are compiled together with field measurements of pH and water temperature in Appendix 5, Table A5-1.

The charge balance errors give an indication of the quality and uncertainty of the analyses of major constituents. The errors exceed  $\pm 5\%$  in 11 cases and no case exceeded  $\pm 10\%$  out of 105 datasets. Furthermore, duplicate analyses by a second laboratory are conducted regularly. Comparison between results from different laboratories and methods shows acceptable agreement in most cases.

To provide a rough check of the data, the electrical conductivity values are plotted versus the corresponding chloride concentrations in Figure 6-1. As shown, the surface water data generally agree well with a thought regression line.

Sulphate by ion chromatography and sulphate calculated from total sulphur by ICP are compared in Figure 6-2. As shown, within the analytical error all the sulphur is present as sulphate.

As established earlier /4/, bromide determinations by ion chromatography may be difficult at high chloride concentrations. Selected bromide values (in most cases ICP results) for each sample are plotted versus the corresponding chloride concentrations in Figure 6-3 as a consistency check. The points do not differ too much from the linear trend and the data are therefore considered acceptable.

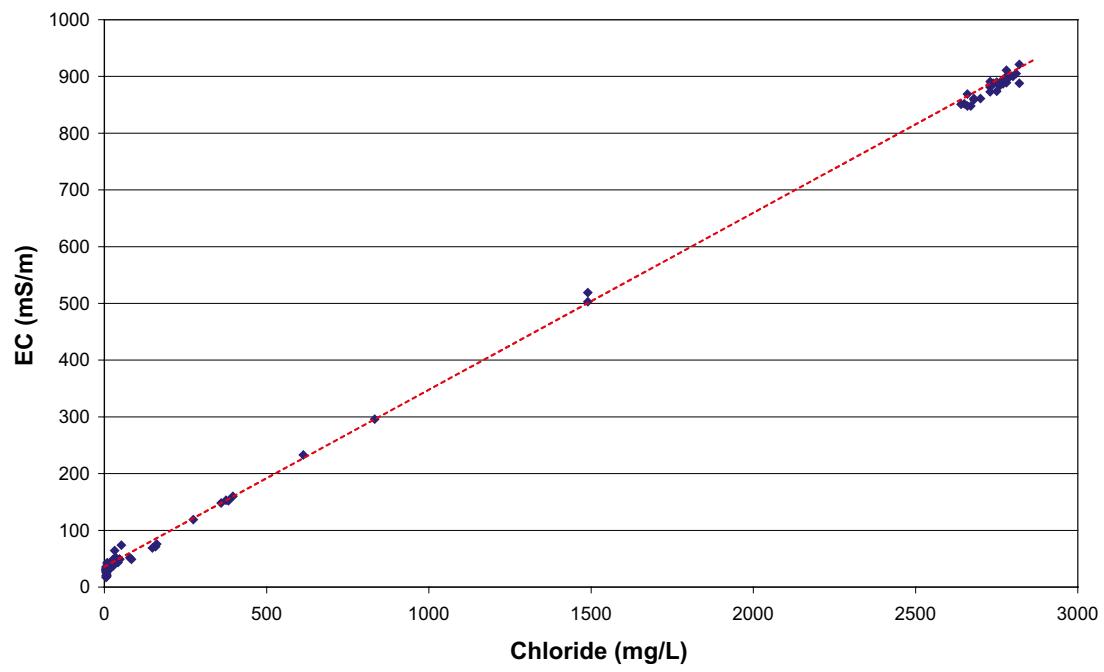

Figure 6-1. Electrical conductivity versus chloride concentrations.

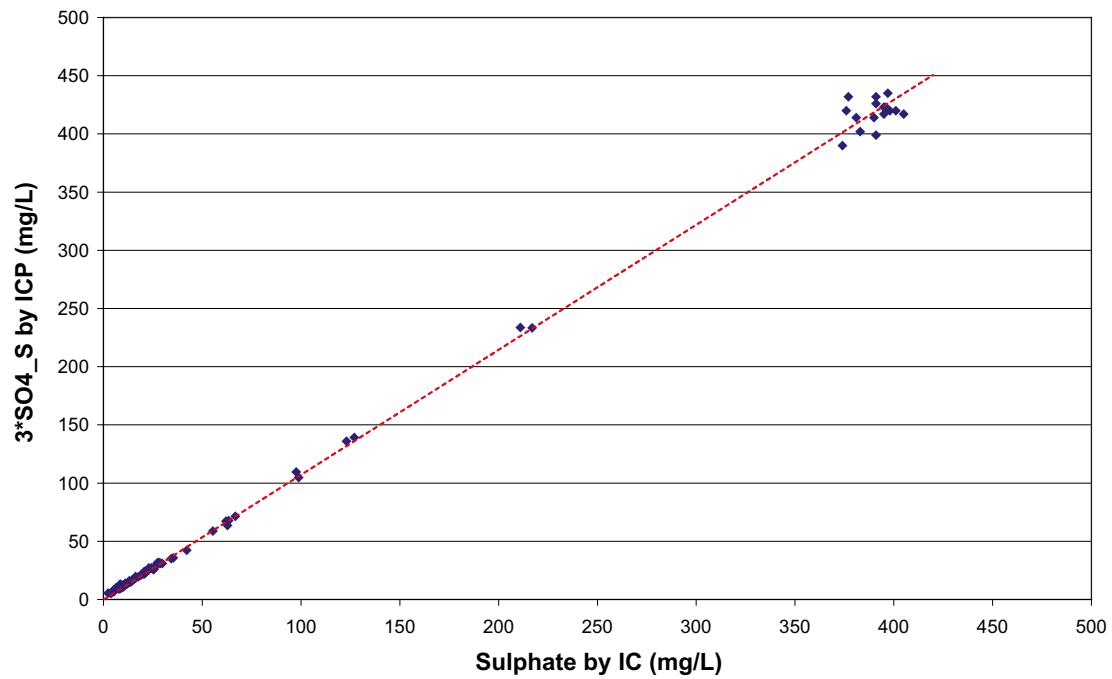

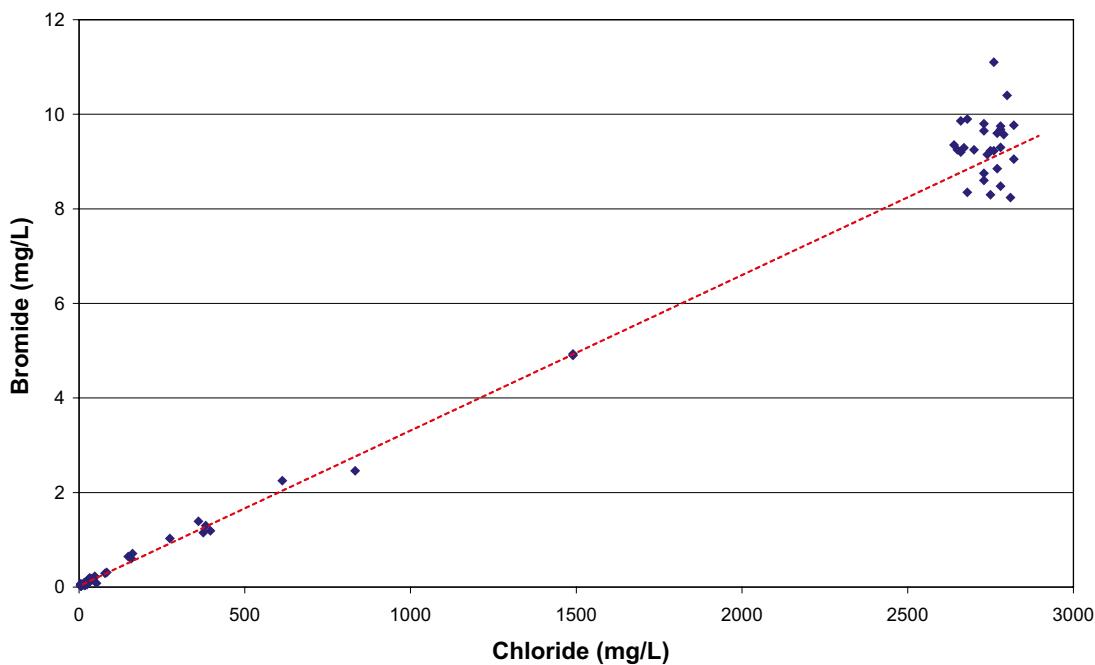

Figure 6-2. Sulphate by IC versus sulphate calculated from total sulphur ( $3 \times SO_4^-S$ ) by ICP.

**Figure 6-3.** Bromide versus chloride.

### 6.2.2 Surface water supplements

The surface water supplements include NH<sub>4</sub>-N, NO<sub>2</sub>-N, NO<sub>3</sub>-N + NO<sub>2</sub>-N, NO<sub>3</sub>-N, tot-N, tot-P, PO<sub>4</sub>-P, TOC, DOC, DIC and sometimes at a few sampling occasions also dissolved oxygen. The analytical data are compiled in Appendix 5, Table A5-2. The DIC values should be used with care and bicarbonate values (by alkalinity titration) are considered more reliable.

### 6.2.3 Isotopes

The isotope determinations include the stable isotopes δD, δ<sup>18</sup>O, <sup>10</sup>B/<sup>11</sup>B, δ<sup>34</sup>S, δ<sup>13</sup>C, δ<sup>37</sup>Cl and <sup>87</sup>Sr/<sup>86</sup>Sr as well as the radioactive isotopes Tr (TU), <sup>14</sup>C (pmC), <sup>238</sup>U, <sup>235</sup>U, <sup>234</sup>U, <sup>232</sup>Th, <sup>230</sup>Th, <sup>226</sup>Ra and <sup>222</sup>Rn. The isotope data are compiled in Appendix 5, Table A5-3.

#### Tritium

It has been suggested that the adjacent nuclear power plant may have influenced the natural conditions for the tritium and <sup>14</sup>C isotopes /4/. Some relation between the presence of these isotopes and distance from the nuclear power reactors was observed during a previous sampling period March 2004–June 2005. In order to better understand the tritium data, repeated tritium determinations from close to the outlet of reactor cooling water commenced in July 2005. One very high tritium value was observed in July 2005 /5/ and three of the samples collected during this reported period July 2006–June 2007 revealed enhanced tritium concentration (16.5, 40.12 and 17.5 TU). These circumstances indicate that contamination from the nuclear power plant does occur at times. Samples from the regular sampling locations did not measure any exceptionally high tritium contents during this last year.

#### **6.2.4 Trace metals**

The analyses of trace elements include Al, As, Cd, Cr, Cu, Co, Hg, Ni, Zn, Pb, V, Mo, B and Ba. The trace element data are compiled in Appendix 5, Table A5-4.

These elements are generally present at low concentrations in the groundwater and the risk for contamination is high. Especially data on common metals like Al, Cr, Cu, Co, Ni and Zn must be used with caution. Generally, the distribution of data is location specific but outliers do exist; significantly large deviating concentrations for a sampling location are rejected in the Sicada database.

### **6.3 Field measurements**

The field measurement data including redox potential, pH, dissolved oxygen, electrical conductivity, salinity, barometric pressure, turbidity, chlorophyll, light penetration, PAR (Photosynthetic Active Radiation) and water temperature are compiled in Appendix 2. The PAR-profile logs are presented as diagrams including regression constants in Appendix 3. Two sets of data are of lower quality; 1) sonde measurements (YSI 6600 EDS) of chlorophyll, and 2) turbidity measurements also by the sonde.

- The water flow rate estimations (not in the report) by the float method /8/ are of low accuracy compared to measurements using discharge weirs and gauges. They were performed in order to allow comparison between early data obtained when there was no other available method and new data from installed measurement stations.
- The chlorophyll measurements have been problematic, possibly due to the fact that humic substances and chlorophyll have similar fluorescence in the wavelength used by the sonde. Since the inland waters show high concentrations of humic substances and the sonde interprets humus as chlorophyll, the amount of chlorophyll tends to be overestimated.
- The turbidity measurements performed in the sea and in lakes often display negative values. This may be due to bad probe sensitivity in clear waters (turbidity weak waters) or calibration problems.

Comments on the low quality of chlorophyll and turbidity data as well as explanations to these circumstances are stored in the Sicada database.

## 7 Summary and discussion

The chemical investigation routines for surface waters are well established after more than five years of field work, reporting and data administration and the third year of the long-term surface water monitoring programme has passed without any major nonconformities or surprises.

The main experiences and conclusions from surface water sampling and analyses since July 2006 are summarised below:

- The statements/findings regarding the character of the surface waters after the fifth year of sampling and analyses remain unchanged.
- The additional data records from the deep seawater location verify the stable chemical conditions that are expected in seawater.
- Sampling performed close to the outlet of cooling water from the power plant for tritium analyses revealed three enhanced values during the reported time period. Therefore it seems clear that contamination from the nuclear power plant may occur at times.

1. Reporting limits (RL), generally 10×standard deviation, are presented if nothing else is stated.
2. Measurement uncertainty reported by the laboratory, generally 95% confidence interval.
3. Reporting limits at electrical cond. 520 mS/m, 1440 mS/m and 3810 mS/m respectively.
4. Measurement uncertainty at concentrations 100×RL.
5. Measurement uncertainty at concentrations 10×RL.
6. Determined only in surface waters and near surface groundwater.
7. Per mille deviation<sup>15</sup> from SMOW (Standard Mean Oceanic Water).
8. TU=Tritium Units, where one TU corresponds to a tritium/hydrogen ratio of 10<sup>-18</sup> (1 Bq/L Tritium = 8.45 TU).
9. Per mille deviation<sup>15</sup> from SMOC (Standard Mean Oceanic Chloride).
10. Per mille deviation<sup>15</sup> from PDB (the standard PeeDee Belemnite).
11. The following relation is valid between pmC (percent modern carbon) and Carbon-14 age:  

$$pmC = 100 \times e^{((1950-y-1.03t)/8274)}$$
 where y = the year of the C-14 measurement and t = C-14 age.
12. Per mille deviation<sup>15</sup> from CDT (the standard Canyon Diablo Troilite).
13. Isotope ratio without unit.
14. The following expressions are applicable to convert activity to concentration, for uranium-238 and thorium-232: 1 ppm U = 12.4 Bq/kg<sup>238</sup>U, 1 ppm Th = 3.93 Bq/kg<sup>232</sup>Th.
15. Isotopes are often reported as per mill deviation from a standard. The deviation is calculated as:  

$$\delta_{\text{I}} = 1000 \times (K_{\text{sample}} - K_{\text{standard}}) / K_{\text{standard}}$$
, where K= the isotope ratio and I = <sup>2</sup>H, <sup>18</sup>O, <sup>37</sup>Cl, <sup>13</sup>C or <sup>34</sup>S etc.
16. SKB estimation from doublet analyses by the contracted laboratory.

## Appendix 2

### Field measurements

Table A2-1.

pH\_L = pH, laboratory measurement at 25 C

EC\_L = Electrical Conductivity, laboratory measurement at 25 C

RCB = Relative Charge Balance error

< value = below reporting or detection limit

Sicada table: water\_composition 2006-07-01 to 2007-06-30
