**Keywords:** Äspö HRL, Prototype Repository, Hydrogeology, Hydraulic tests, Pressure build-up tests, Hydraulic parameters, Transmissivity, Storage coefficient

This report concerns a study which was conducted for SKB. The conclusions and viewpoints presented in the report are those of the author(s) and do not necessarily coincide with those of the client.

# **Abstract**

The Äspö Hard Rock Laboratory (HRL) is located in the Simpevarp area, southeast Sweden, some 35 km north of Oskarshamn. Construction of the underground laboratory commenced in 1990 and was completed in 1995, consisting of a 3.6 km long tunnel excavated in crystalline rock to a depth of approximately 460 m. Prior to, during and subsequent to completion, research concerning the deep geological disposal of nuclear waste in fractured crystalline rock has been carried out. Central to this research has been the characterisation of the groundwater flow system and the chemistry of the groundwater at Äspö prior to excavation (Pre-investigation Phase) and subsequently to monitor changes in these parameters during the evolution of laboratory construction (Construction Phase).

The Prototype Repository Test is focused on testing and demonstrating the function of the SKB deep repository system. Activities aimed at contributing to development and testing of the practical, engineering measures required to rationally perform the steps of a deposition sequence are also included in the project but are also part of other projects.

This report describes

- Diaper measurements of two canister holes DA3545G01 and DA3551G01
- Flow measurements in tunnel A and tunnel G
- past grouting activities close to the prototype repository
- grouting activities close to Plug 1 and Plug 2

The status of the done measurements and flow measurements in weirs are updated until October 31, 2004.

The report is intended to describe results from the characterisation stage that were not possible to incorporate in the summary report of the characterisation stage.

# **Sammanfattning**

Äspölaboratoriet är lokalisert i Simpevarpsregionen i sydöstra Sverige, ca 35 km norr om Oskarshamn. Byggandet av underjordslaboratoriet, som påbörjades 1990 och färdigställdes 1995, består av en 3.6 km lång tunnel utsprängd och borrad i kristallin berggrund ner till ett djup av ca 460m. Innan, under och efter färdigställandet av laboratoriet har forskning genomförts som rör djupförvar av kärnavfall i kristallin berggrund. Centralt för denna forskning har varit karakteriseringen av grundvattenflödessystemet och grundvattenkemin vid Äspö innan tunnelbygget (Förundersökningsfas) och att därefter följa upp dessa parametrar under byggandet av laboratoriet (Konstruktionsfas).

Huvudsyftet med prototypförvaret är att testa och demonstrera funktionen av en del av SKB:s djupförvars system. Aktiviteter som syftar till utveckling och försök av praktiska och ingenjörsmässiga lösningar, som krävs för att på ett rationellt sätt kunna stegvis utföra deponeringen av kapslar med kärnbränsle, är inkluderade i prototypförvarsprojektet men även i andra projekt.

Denna rapport behandlar

- Detaljerade flödesmätningar i depositionshål DA3545G01 och DA3551G01
- Flödesmätningar i tunnel A och i tunnel G
- Historiska injekteringsinsatser av bergmassan i närheten av prototypförvaret
- Injekteringar runt plugg 1 och 2

Genomförda mätningar är uppdaterade till och med 2004-10-31.

Rapporten avses behandla resultat från förundersökningsfasen som inte var möjliga att rapporteras av i sammanfattningsrapporten för förundersökningarna.

# **Executive summary**

The Äspö Hard Rock Laboratory (HRL) is located in the Simpevarp area, southeast Sweden, some 35 km north of Oskarshamn. Construction of the underground laboratory commenced in 1990 and was completed in 1995, consisting of a 3.6 km long tunnel excavated in crystalline rock to a depth of approximately 460 m. Prior to, during and subsequent to completion, research concerning the deep geological disposal of nuclear waste in fractured crystalline rock has been carried out. Central to this research has been the characterisation of the groundwater flow system and the chemistry of the groundwater at Äspö prior to excavation (Pre-investigation Phase) and subsequently to monitor changes in these parameters during the evolution of laboratory construction (Construction Phase).

The Prototype Repository Test is focused on testing and demonstrating the function of the SKB deep repository system. Activities aimed at contributing to development and testing of the practical, engineering measures required to rationally perform the steps of a deposition sequence are also included in the project but are also part of other projects.

This report describes

- Diaper measurements of two canister holes DA3545G01 and DA3551G01
- Flow measurements in tunnel A and tunnel G
- past grouting activities close to the prototype repository
- grouting activities close to Plug 1 and Plug 2

The status of the done measurements and flow measurements in weirs are updated until October 31, 2004.

The report is intended to describe results from the characterisation stage that were not possible to incorporate in the summary report of the characterisation stage, (Rhén, Forsmark, 2001).

# 1 Background

## 1.1 Äspö Hard Rock Laboratory

In order to prepare for the siting and licensing of a spent fuel repository SKB has constructed an underground research laboratory.

In the autumn of 1990, SKB began the construction of Äspö Hard Rock Laboratory (Äspö HRL), see Figure 1-1, near Oskarshamn in the south-eastern part of Sweden. A 3.6 km long tunnel was excavated in crystalline rock down to a depth of approximately 460 m.

The laboratory was completed in 1995 and research concerning the disposal of nuclear waste in crystalline rock has since been carried out.

**Figure 1-1. Äspö Hard Rock Laboratory**

## 1.2 Prototype repository

The Äspö Hard Rock Laboratory is an essential part of the research, development, and demonstration work performed by SKB in preparation for construction and operation of the deep repository for spent fuel. Within the scope of the SKB program for RD&D 1995, SKB has decided to carry out a project with the designation "Prototype Repository Test". The aim of the project is to test important components in the SKB deep repository system in full scale and in a realistic environment.

The Prototype Repository Test is focused on testing and demonstrating the function of the SKB deep repository system. Activities aimed at contributing to development and testing of the practical, engineering measures required to rationally perform the steps of a deposition sequence are also included. However, efforts in this direction are limited, since these matters are addressed in the Demonstration of Repository Technology project and to some extent in the Backfill and Plug Test.

### **1.2.1 General objectives**

The Prototype Repository should simulate, in as many aspects as possible, a real repository, regarding for example geometry, materials, and rock environment. The Prototype Repository is a demonstration of the integrated function of the repository components. Results will be compared with conceptual and numerical models and assumptions to their validity.

The major objectives for the Prototype Repository are:

- To test and demonstrate the integrated function of the repository components under realistic conditions in full scale and to compare results with conceptual and numerical models and assumptions.
- To develop, test and demonstrate appropriate engineering standards and quality assurance methods.
- To simulate appropriate parts of the repository design and construction process.
- To provide a full-scale reference for testing/scrutinization of models, experiments and assumptions

The objectives for the characterisation program are:

- To provide a basis for determination of localisation of the deposition holes
- To provide data on boundary and rock conditions to enable interpretation of the experimental data

### **1.2.2 Characterisation stages**

The characterisation will be made in three stages. Each stage is intended to contribute to more details useful for the determination of the localisation of the deposition holes and also the boundary and rock conditions needed for the interpretation of the experimental data. The three stages are:

1. Mapping of the tunnel
2. Pilot and exploratory holes
3. Deposition holes

This report describes the inflow measurements into the prototype tunnel, to the deposition boreholes and to the lead-through boreholes. It also details the pressure responses observed during the drilling of the deposition- and lead-through boreholes as well as the results from four pressure build-up tests made in the three lead-through boreholes. Pressure responses from blasting niches for the plugs are shown, discussed and are also included in the document.

## **2    Objective**

The Prototype Repository should simulate a real repository in as many aspects as possible, regarding geometry, materials and rock environment. The Prototype Repository is a demonstration of the integrated function of the repository components. Results will be compared with models and assumptions to their validity.

The objectives for the pressure response observations during the drilling of the deposition boreholes and the inleakage measurements in the tunnel and into the deposition boreholes are:

- To provide data for the estimation of the wetting process of the bentonite clay surrounding the canisters
- To provide data for the structure model of the rock volume around the prototype repository
- To provide data for the numerical groundwater flow modeling

The objectives of the pressure response observations during the drilling of the lead-through boreholes and of the hydraulic tests in the holes are:

- To detect any hydraulic connections with already existing boreholes and thus provide additional data to the structure model
- To hydraulically characterise the boreholes before the planned grouting

The objectives, of the pressure response observations during the blasting of the niches for the plugs in the Prototype tunnel, are:

- To provide data to evaluate possible pressure changes and their cause in monitored sections around the Prototype tunnel

The report is intended to describe results from the characterisation stage that were not possible to incorporate in the summary report of the characterisation stage, (Rhén, Forsmark, 2001).

### **3 Scope**

In the prototype repository tunnel floor, six 1.75 meter wide deposition holes have been drilled. From the G-tunnel, which runs on the north side of the prototype tunnel, three lead-through boreholes have been drilled and tested.

Inleakage measurements of the boreholes have been made during three measurement campaigns. Each deposition borehole has been mapped in regard to inflow features and these have been monitored in detail. In two of the deposition boreholes a very detailed inflow measurement was done during the winter of 2002. The results are presented in chapter 4.

Inleakage rates to different tunnel parts are made. In this report in chapter 5 the leaking rate close to plug 1, the inflow rate to slit 2, the flowrate downstream of plug 2 and the flowrate to tunnel G is presented.

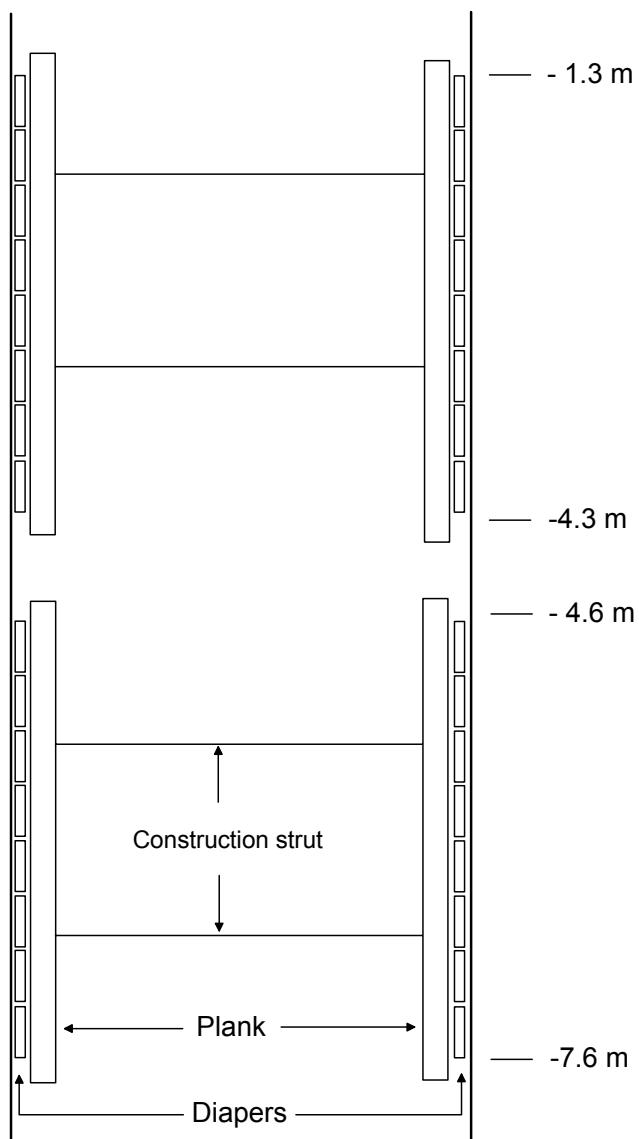

In chapter 6 known grouting activities from 1994 up to present day are detailed.

## 4 Deposition boreholes

### 4.1 Diaper measurement inflow rate to prototype repository deposition borehole KA3551G01

Ordinary baby diapers were applied to a plank. A total of 8 diapers were applied in a row to each of 78 planks. Each diaper was weighted before applying to the plank. All of the plank-diaper arrangements were then applied tight to the borehole wall. The first 39 were applied vertically at level 4.60 – 7.60 meters and the last 25 were applied vertically at level 1.30 – 4.30 meters. After the end of the period each diaper was again weighted to be able to estimate the inflow to each diaper. Measurement data is detailed in Appendix 1.

**Figure 4-1.** Diaper measurement arrangement in DA3551G01

A detailed flow measurement was done in DA3551G01 2002-01-09 to 2002-01-17. Due to leakage from a tunnel wall hole 13 plank rows were re-measured 2002-01-18 to 2002-01-24.

To be able to estimate the effect of the background humidity on water content in the diaper some reference diapers were used at different levels in the borehole. The results of these reference measurements are that the reference diapers increased its weight by 4.5 to 7.6 grams giving an average increase of 5.57 grams. Three of the diapers were hanging free in the air at levels 6 m, 4 m and 2 m below tunnel floor in the borehole. Three diapers was mounted in the centre of the hole at a level of 4 meter below tunnel floor and covered with a steel plate on both sides. Eight diapers were mounted on the outside of a plank in row 1, 10, 20 and 30 respectively at both the upper and the lower level.

A simple test was carried out to see how much water a diaper could absorb. With 200 g water the diaper felt moist, and with 300 g it was possible to squeeze the water out of the diaper. Considering the increase of the water content in the diapers nearly none of the diapers became saturated during the experiment, see Appendix 1.

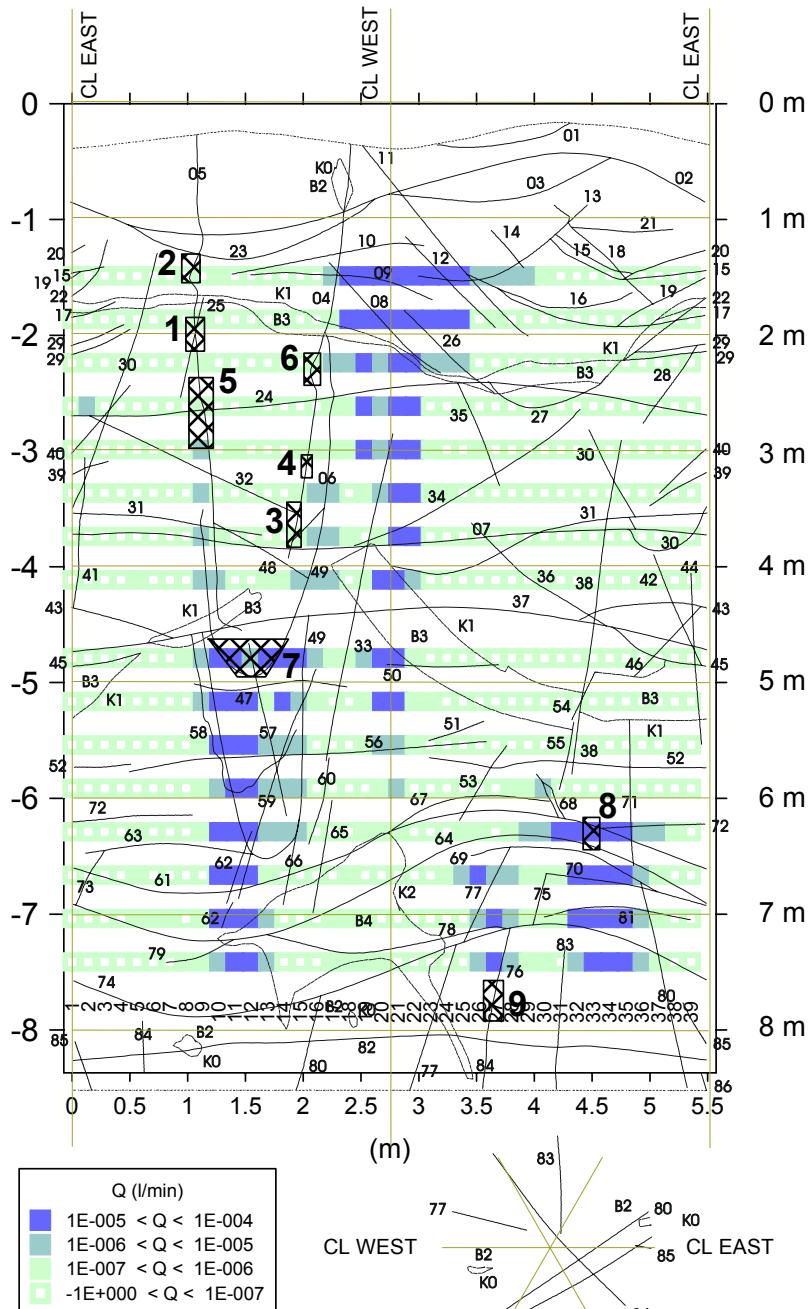

A weight increase of 0 – 1 grams is considered as uncertain, giving that an increase of 1 gram could represent a “zero” flow as well as flow causing an increase of 1 gram. A 1 gram increase during one week gives a flow of  $1 \cdot 10^{-7}$  L/min. This flow is therefore set as the measurement limit of this methodology.

Each diaper covered an area of 0.03465 ( $0.11 \times 0.315$ ) m<sup>2</sup>. The distance between the planks is approximately 0.05 meters.

The planks were mounted clock-wise along the circumference of the borehole. Plank 1 was situated in the centreline of the tunnel facing east towards the tunnel opening.

In Figure 4-2 the result is shown graphically together with the geological mapping of structures and inleaking locations. Leakage points are numbered 1 – 9.

## DA3551G01 - INFLOW MEASUREMENTS USING DIAPERS

**Figure 4-2.** Inflow measurements using diapers in DA3551G01.

In total the measurement gives an estimated borehole flow of  $3 \cdot 10^{-3}$  L/min. In the calculation the total measured flow (water absorbed by diapers) is  $1.6 \cdot 10^{-4}$  L/min. Taken into account that parts of the borehole is not covered by diapers this flow was upscaled by a factor 2. The estimated flow is a factor 2 larger than earlier whole borehole measurements (Rhen, Forsmark, 2001) have indicated but still is within the same order of magnitude as earlier measurements.

If the pressure in the rock mass is known the measured flow can be translated to a hydraulic conductivity. To be able to estimate a relevant pressure, measured pressures in existing boreholes close to the deposition holes were utilised to develop a relationship between the distance between the deposition borehole centre and the pressure at a location in the rockmass outside the borehole wall. In Table 4-1 the utilised pressures are presented together with the distance to the centre of the closest deposition borehole.

**Table 4-1 Utilized pressures when developing a relationship between the horizontal distance between the deposition borehole centre and and the pressure at a location in the rockmass outside the borehole wall. Pressures for the inner section are from July 1999 and for the outer section from January 2000.**

The pressures in the Table 4-1 above are pressures measured 6 – 12 months before the diaper measurements. This fact may cause that the pressures in some cases are overrated since the open deposition boreholes will reduce the pressure in the closest surrounding rockmass. This will, mostly, be the case in the borehole sections with the highest pressure. The declining pressure trend is, however, at most 2 – 3 metres per month in those sections in the outer section where pressure time series are available.

The pressure at the borehole wall with the radius 0.875 meters is set to 0. The simple regression analysis gives the following relationship with a correlation coefficient of 0.59, which indicates a relatively strong relationship between the variables. The relationship shown in Figure 4-3 is

$$P = 7.835 + 94.397 \cdot \text{LOG}_R$$

**Figure 4-3.** Simple regression analysis with 95 % confidence limits (inner pair of dotted lines) for mean value and predicted value

The hydraulic conductivity, K, was estimated using Thiem's relationship in the form below:

$$K = q \cdot r_1 \cdot \ln(r_2 / r_1) / (P_2 - P_1) \text{ where}$$

$q$  = measured inflow for each area covered with a diaper ( $\text{m}^3/\text{s} \cdot \text{m}^2$ )

$r_1$  = radius of deposition borehole (=0.875 m)

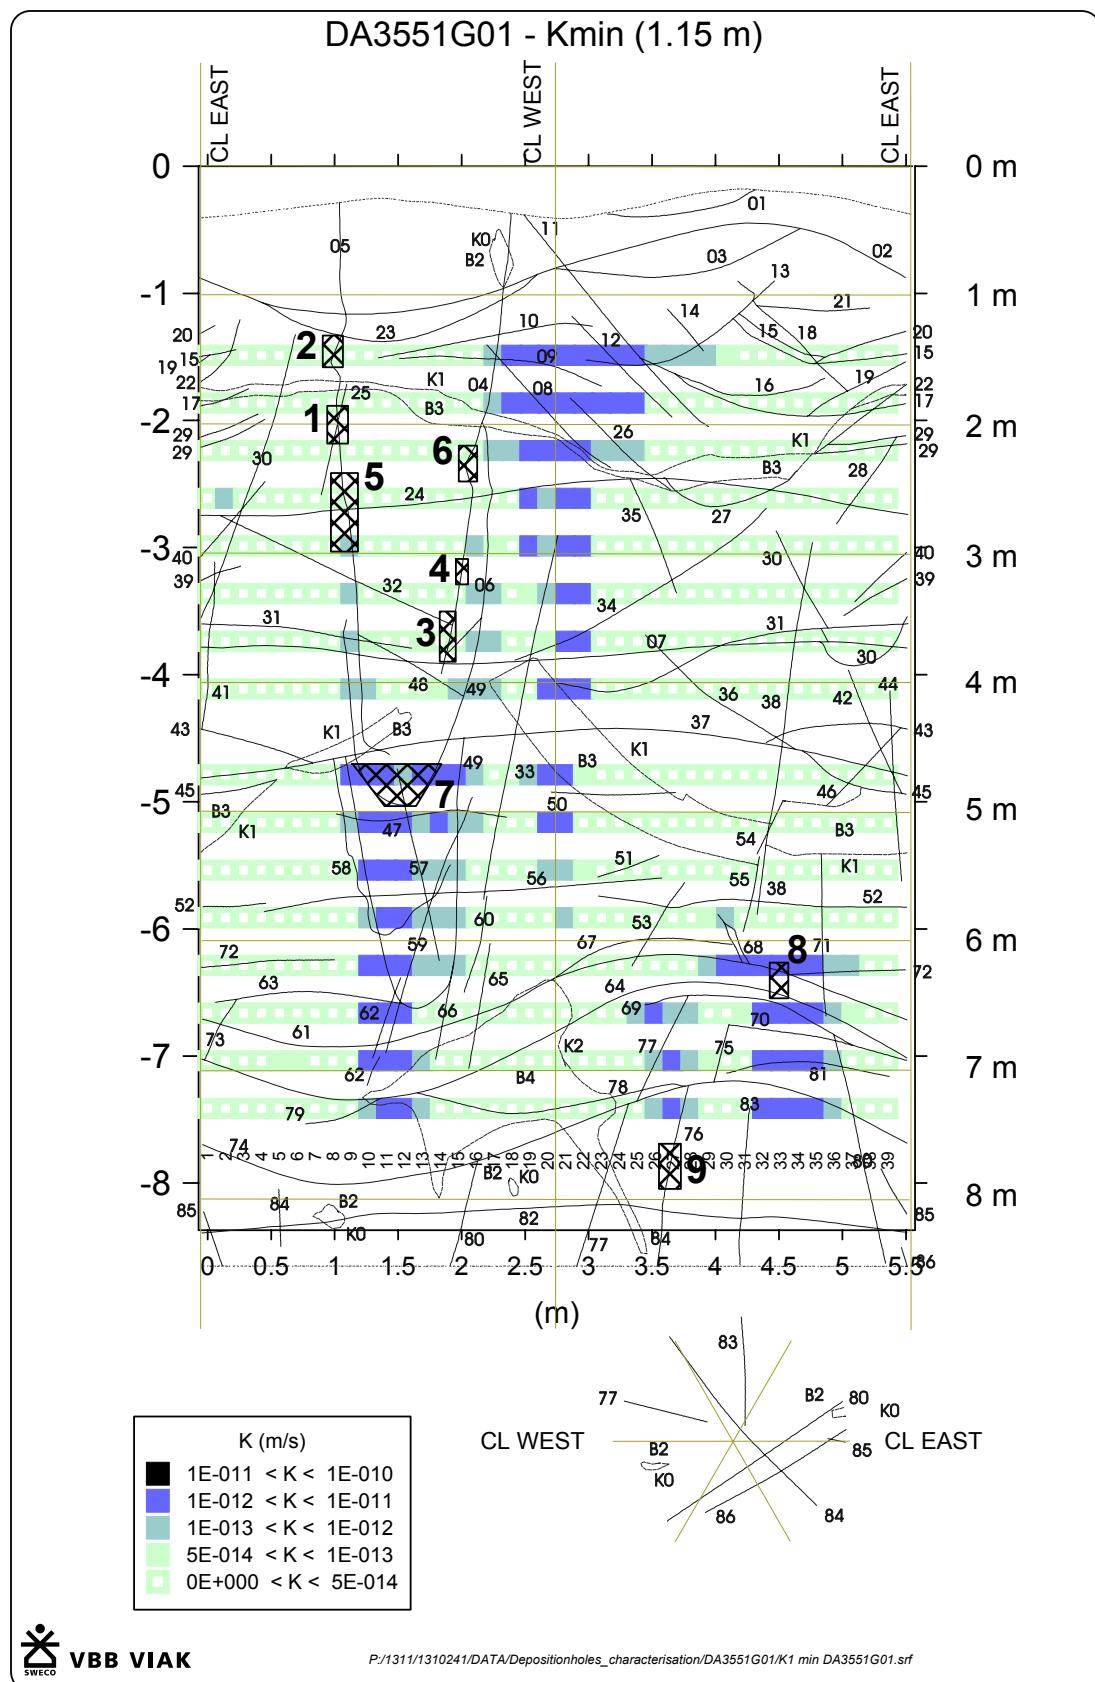

$r_2$  = distance to location outside borehole from borehole centre, where pressure is estimated from relationship above

$P_1$  = Pressure at borehole wall (=0 m of water)

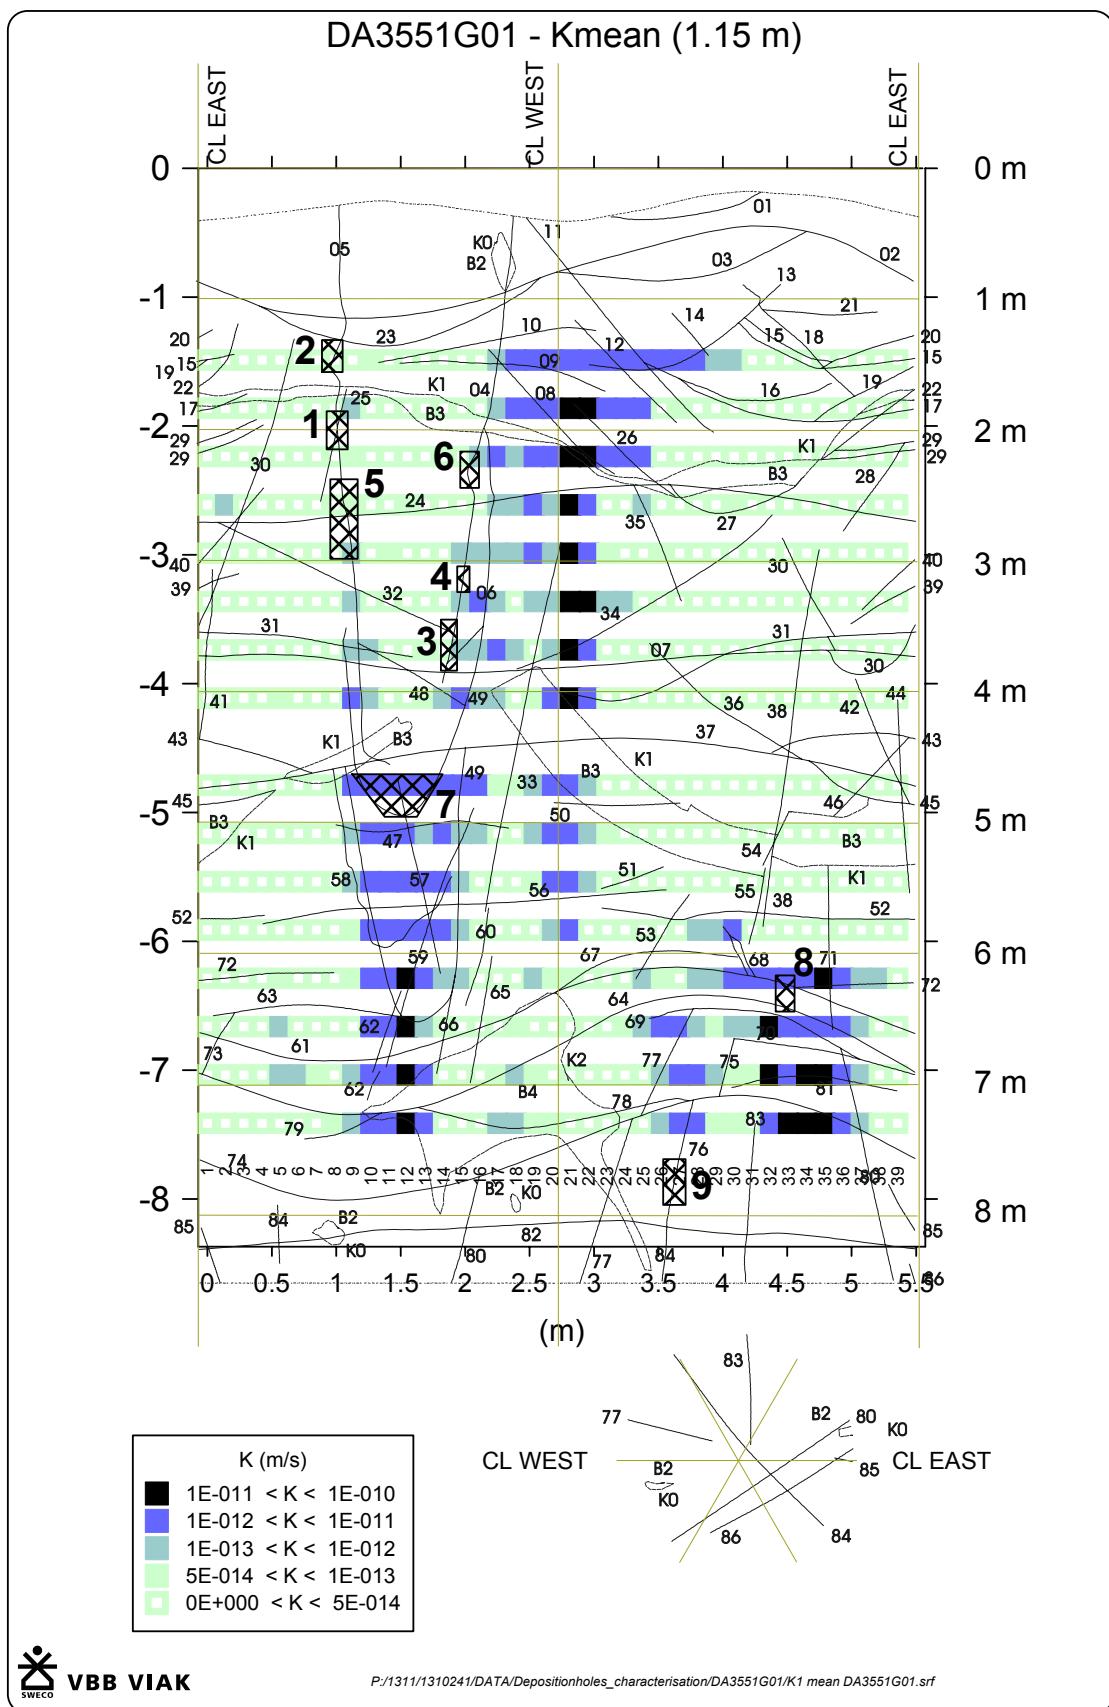

$P_2$  = Pressure estimated from relationship above (meters of water)

Two cases have been calculated for. The first is with  $r_2 = 1.15$  m and the second with  $r_2 = 5$  m. The pressure  $P_2$  used for the different cases are shown in *Figure 4-3*. The resulting  $K_{\min}$ ,  $K_{\text{mean}}$  and  $K_{\max}$  are presented in *Figures 4-4* to *4-6* and in *Appendix 1*.

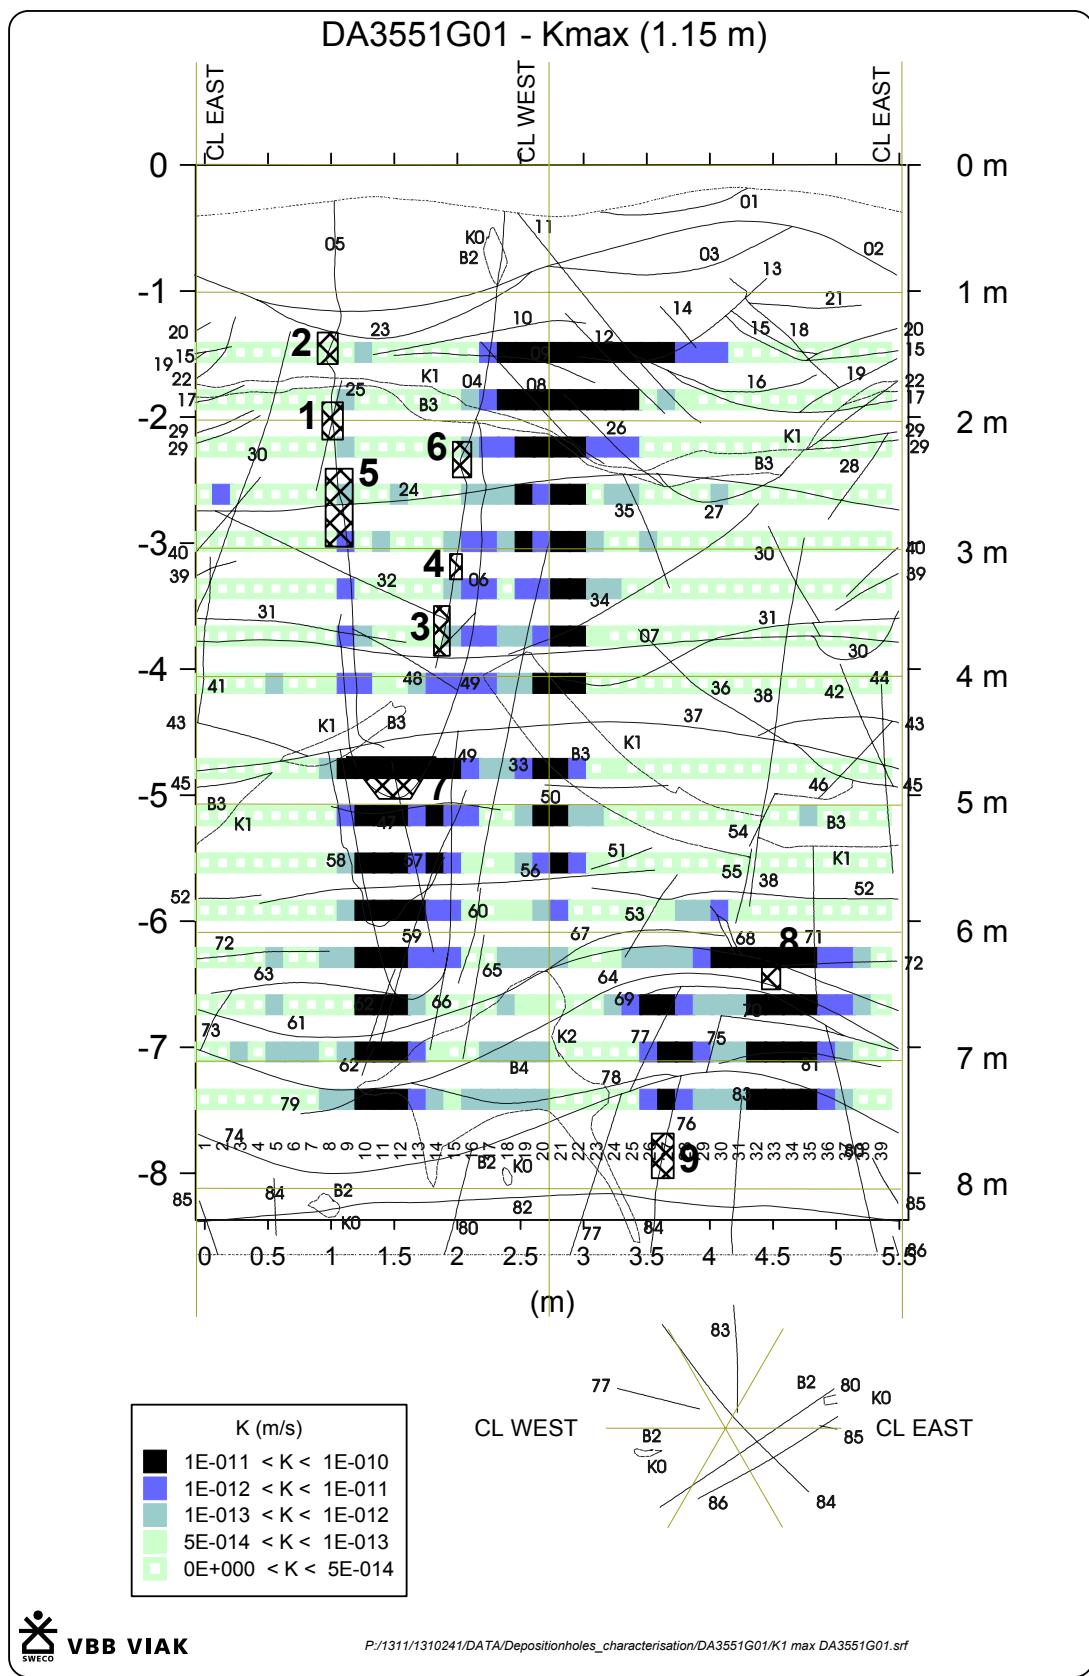

As earlier described the estimated measurement limit of a diaper is +/- 1 gram. Using the different extreme pressures,  $P_2$ , in *Figure 4-3* above this indicate a hydraulic conductivity (m/s) interval for the 1.15 meter case of  $5.6 \cdot 10^{-14}$  ( $P_{\min}$ ) –  $3.8 \cdot 10^{-15}$  ( $P_{\max}$ ) and for the 5 meter case of  $5.1 \cdot 10^{-14}$  ( $P_{\min}$ ) –  $1.2 \cdot 10^{-14}$  ( $P_{\max}$ ). Considering this, the measurement limit for hydraulic conductivity is estimated to be  $5 \cdot 10^{-14}$  m/s.

**Figure 4-4.** Estimated  $K_{min}$  at distance 1.15 meters from borehole center

**Figure 4-5.** Estimated  $K_{mean}$  at distance 1.15 meters from borehole center

**Figure 4-6.** Estimated  $K_{max}$  at distance 1.15 meters from borehole center

The result of a statistical analysis of  $K_{\min}$ ,  $K_{\text{mean}}$  and  $K_{\max}$  for the two distances 1.15 and 5 meters from deposition borehole centre is shown in *Table 4-2*. Detailed results are presented in Appendix 1.

**Table 4-2 Result of statistical analysis of  $K_{\min}$ ,  $K_{\text{mean}}$  and  $K_{\max}$  for the two distances 1.15 and 5 meters from deposition borehole centre**

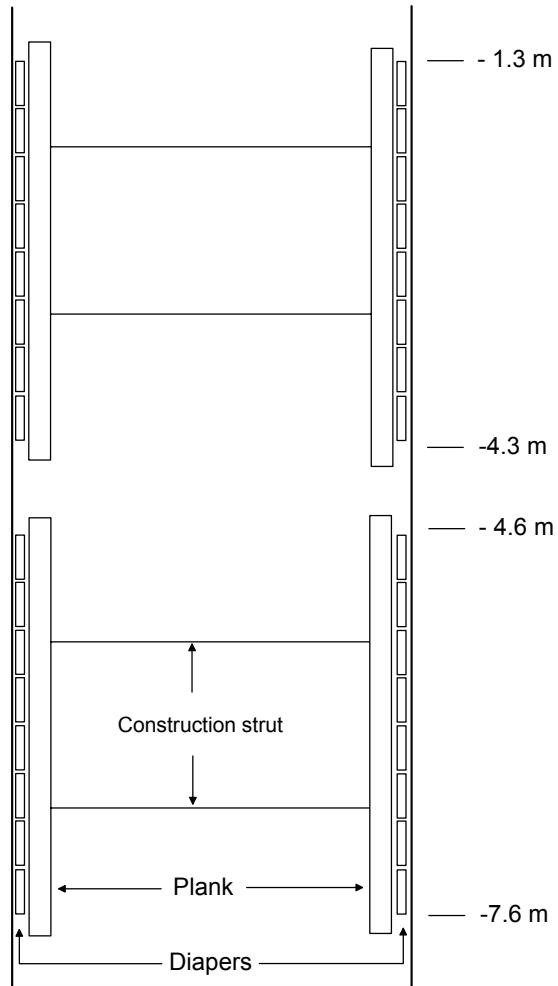

Data set	Geometric mean (m/s)	Standard deviation (Log10 K)
$K_{\min}$ ( $d = 1.15$ m)	$9.8 \cdot 10^{-14}$	2.7 *
$K_{\text{mean}}$ ( $d = 1.15$ m)	$1.5 \cdot 10^{-13}$	3.0 *
$K_{\max}$ ( $d = 1.15$ m)	$2.5 \cdot 10^{-13}$	2.7 *
$K_{\min}$ ( $d = 5$ m)	$1.0 \cdot 10^{-13}$	2.7 *
$K_{\text{mean}}$ ( $d = 5$ m)	$1.2 \cdot 10^{-13}$	3.0 *
$K_{\max}$ ( $d = 5$ m)	$2.1 \cdot 10^{-13}$	2.7 *

\* estimated by fitting a line (dotted line in Appendix 1) in the probability diagram in Appendix 1

It is to be remembered in this context that some of the higher inflow spots probably reflect water coming from a fracture above them, as was pointed out earlier. This means that the statistics probably to some extent is biased. There should probably be fewer values with high K-values but some of the values could possibly be higher (representing the mapped flowing feature).  $K_{\min}$  and  $K_{\max}$  should be seen as the possible range for individual values. The distribution of  $K_{\text{mean}}$  should be the best estimate of the hydraulic conductivity.

## 4.2 Diaper measurement inflow rate to prototype repository deposition borehole KA3545G01

Ordinary baby diapers were applied to a plank. A total of 8 diapers were applied in a row to each of 78 planks. Each diaper was weighted before applying to the plank. All of the plank-diaper arrangements were then applied tight to the borehole wall. The first 39 were applied vertically at level 4.60 – 7.60 meters and the last 25 were applied vertically at level 1.30 – 4.30 meters. After the end of the period each diaper was again weighted to be able to estimate the inflow to each diaper. Measurement data is detailed in Appendix 2.

**Figure 4-7.** Diaper measurement arrangement in DA3545G01

A detailed flow measurement was done in DA3545G01 2002-01-08 to 2002-01-16.

To be able to estimate the effect of the background humidity on water content in the diaper some reference diapers were used at different levels in the borehole. The results of these reference measurements are that the reference diapers increased its weight by 4.0 to 7.4 grams giving an average increase of 5.34 grams. Three of the diapers were hanging free in the air at 0levels 6 m, 4 m and 2 m below tunnel floor in the borehole. Three diapers was mounted in the centre of the hole at a level of 4 meter below tunnel floor and covered with a steel plate on both sides. Eight diapers were mounted on the outside of a plank in row 1, 10, 20 and 30 respectively at both the upper and the lower level.

A simple test was carried out to see how much water a diaper could absorb. With 200 g water the diaper felt moist, and with 300 g it was possible to squeeze the water out of the diaper. Considering the increase of the water content in the diapers nearly none of the diapers became saturated during the experiment, see Appendix 2.

A weight increase of 0 – 1 grams is considered as uncertain, giving that an increase of 1 gram could represent a “zero” flow as well as flow causing an increase of 1 gram. A 1 gram increase during one week gives a flow of  $1 \cdot 10^{-7}$  L/min. This flow is therefore set as the measurement limit of this methodology.

Each diaper covered an area of 0.03465 ( $0.11 \times 0.315$ ) m<sup>2</sup>. The distance between the planks is approximately 0.05 meters.

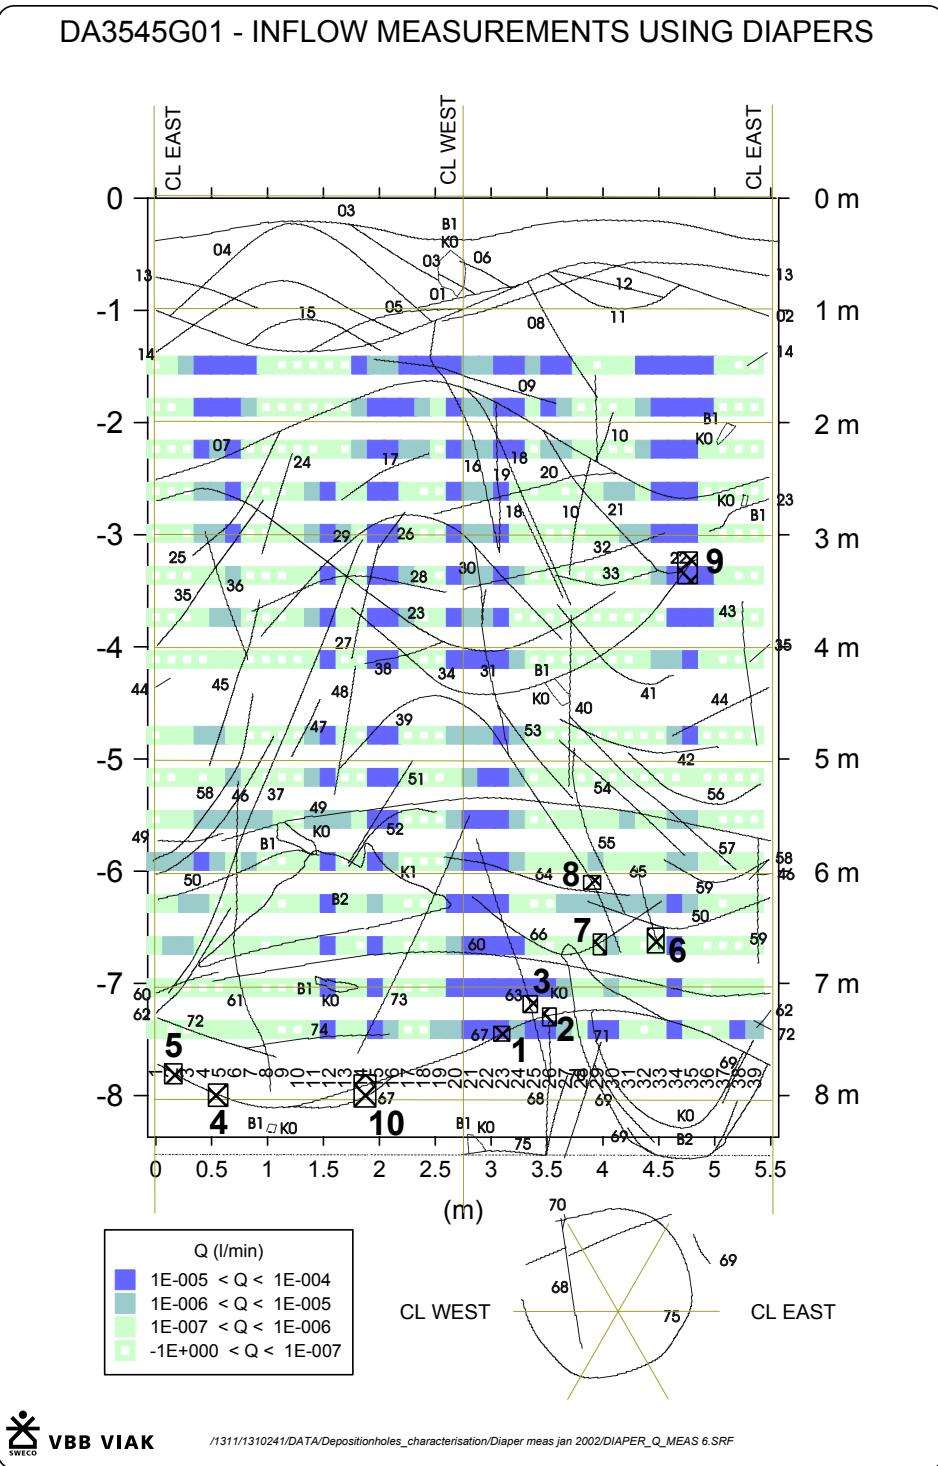

The planks were mounted clock-wise along the circumference of the borehole. Plank 1 was situated in the centreline of the tunnel facing east towards the tunnel opening.

In Figure 4-8 the result is shown graphically together with the geological mapping of structures and inleaking locations. Leakage points are numbered 1 – 10.

Two cases have been calculated for. The first is with  $r_2 = 1.15$  m and the second with  $r_2 = 5$  m. The pressure  $P_2$  used for the different cases are shown in Figure 4-3. The resulting  $K_{\min}$ ,  $K_{\text{mean}}$  and  $K_{\max}$  are presented in Figures 4-9 to 4-11 and in Appendix 2.

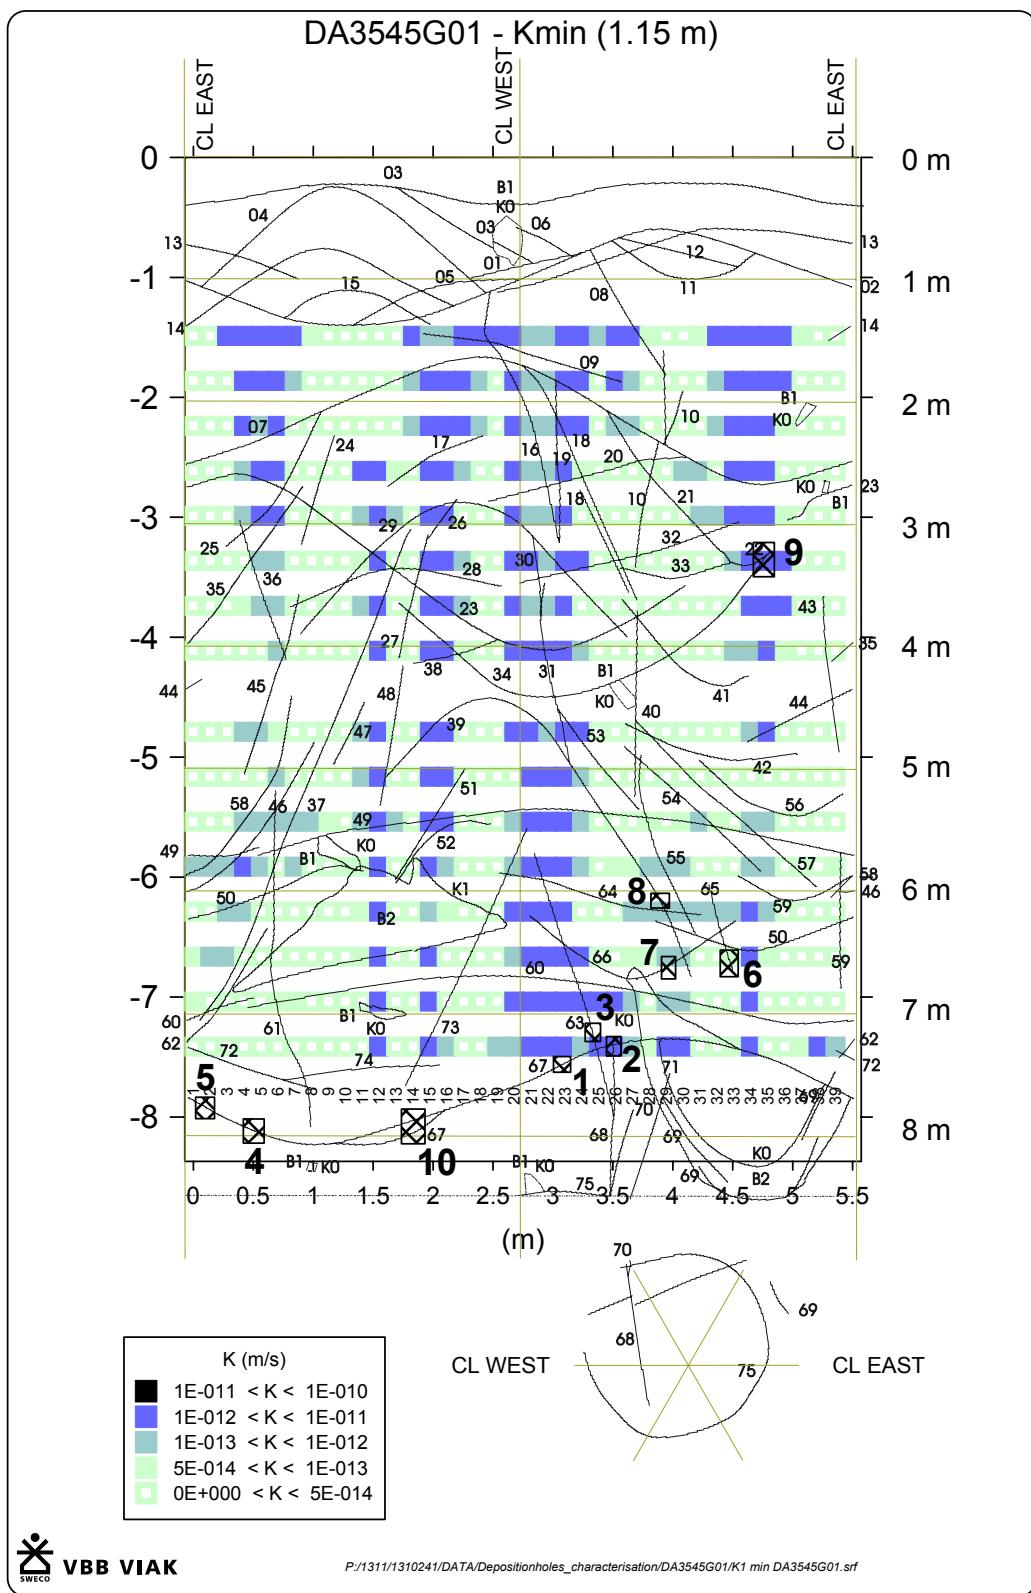

As earlier described the estimated measurement limit of a diaper is +/- 1 gram. Using the different extreme pressures,  $P_2$ , in Figure 4-3 above this indicate a hydraulic conductivity (m/s) interval for the 1.15 meter case of  $5.6 \cdot 10^{-14}$  ( $P_{\min}$ ) –  $3.8 \cdot 10^{-15}$  ( $P_{\max}$ ) and for the 5 meter case of  $5.1 \cdot 10^{-14}$  ( $P_{\min}$ ) –  $1.2 \cdot 10^{-14}$  ( $P_{\max}$ ). Considering this, the measurement limit for hydraulic conductivity is estimated to be  $5 \cdot 10^{-14}$  m/s.

During the measurements a small leakage was detected causing the diapers at the western part of the hole to indicate a somewhat higher flowrate than otherwise. The origin and magnitude of the leakage is uncertain.

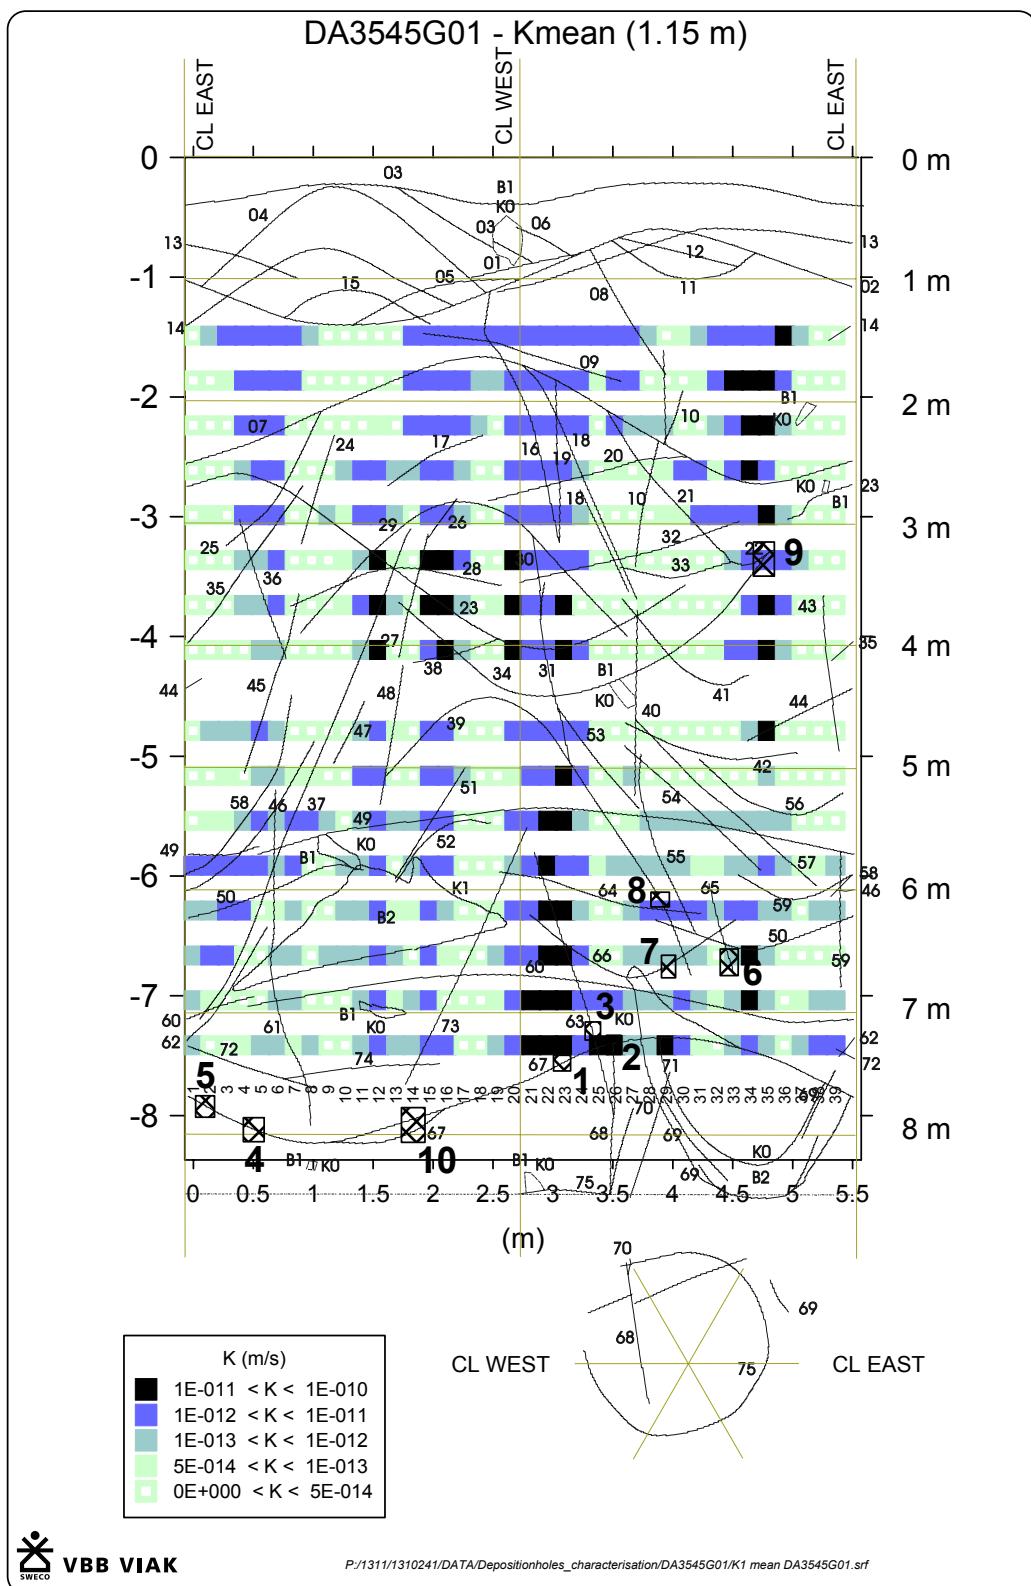

**Figure 4-8.** Inflow measurements using diapers in DA3545G01.

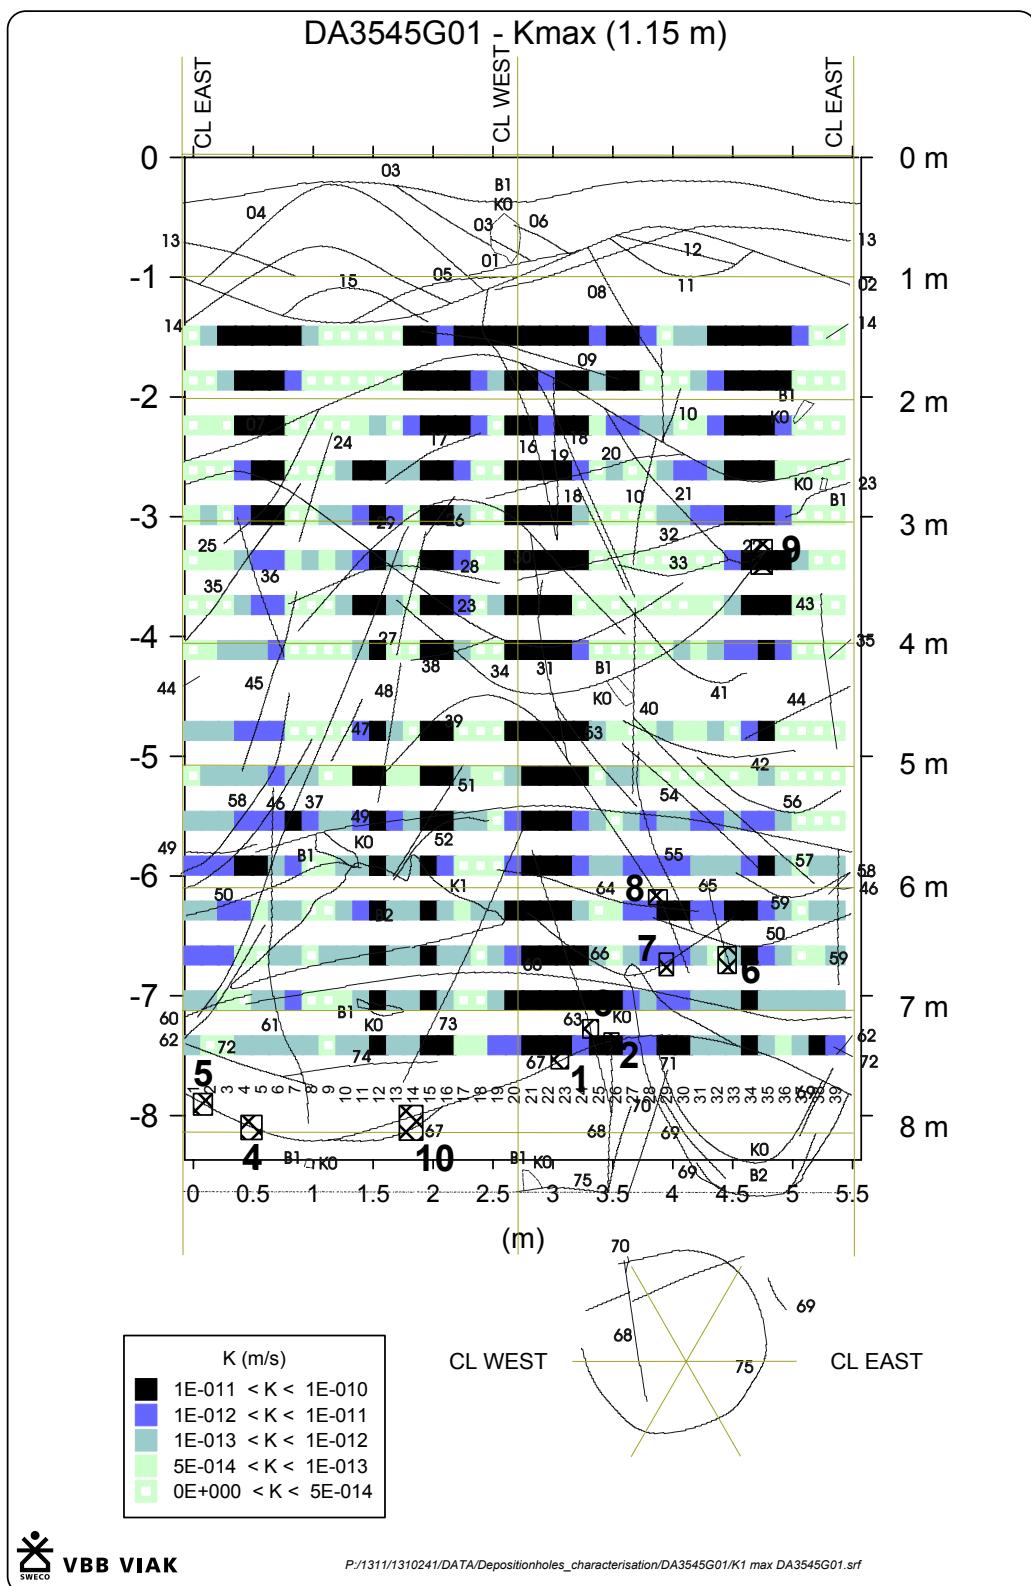

In total the measurement gives an estimated borehole flow of  $6 \cdot 10^{-3}$  L/min. In the calculation the total measured flow (water absorbed by diapers) is  $3.1 \cdot 10^{-4}$  L/min. Taken into account that parts of the borehole is not covered by diapers this flow was upscaled by a factor 2. The estimated flow will then be close to what earlier whole borehole measurements (Rhen, Forsmark, 2001) have indicated. Still the leakage from the tunnelfloor west close to the hole make this flowrate somewhat overestimated but still the inflow ought to be in this order of magnitude.

**Figure 4-9.** Estimated  $K_{min}$  at distance 5 meters from borehole center

**Figure 4-10.** Estimated  $K_{mean}$  at distance 5 meters from borehole center

**Figure 4-11.** Estimated  $K_{max}$  at distance 5 meters from borehole center

The result of a statistical analysis of  $K_{\min}$ ,  $K_{\text{mean}}$  and  $K_{\max}$  for the two distances 1.15 and 5 meters from deposition borehole centre is shown in Table 4-3. Detailed results are presented in Appendix 2.

**Table 4-3 Result of statistical analysis of  $K_{\min}$ ,  $K_{\text{mean}}$  and  $K_{\max}$  for the two distances 1.15 and 5 meters from deposition borehole centre**

Data set	Geometric mean (m/s)	Standard deviation (Log10 K)
$K_{\min}$ ( $d = 1.15$ m)	$1.7 \cdot 10^{-13}$	2.6 *
$K_{\text{mean}}$ ( $d = 1.15$ m)	$3.9 \cdot 10^{-13}$	2.6 *
$K_{\max}$ ( $d = 1.15$ m)	$8.9 \cdot 10^{-13}$	1.8 *
$K_{\min}$ ( $d = 5$ m)	$1.8 \cdot 10^{-13}$	2.8 *
$K_{\text{mean}}$ ( $d = 5$ m)	$2.3 \cdot 10^{-13}$	2.8 *
$K_{\max}$ ( $d = 5$ m)	$4.2 \cdot 10^{-13}$	2.5 *

\*estimated by fitting a line (dotted line i Appendix 1) in the probability diagram in Appendix 1

It is to be remembered in this context that some of the higher inflow spots probably reflect water coming from a fracture above them, as was pointed out earlier. This means that the statistics probably to some extent is biased. There should probably be fewer values with high K-values but some of the values could possibly be higher (representing the mapped flowing feature).  $K_{\min}$  and  $K_{\max}$  should be seen as the possible range for individual values. The distribution of  $K_{\text{mean}}$  should be the best estimate of the hydraulic conductivity.

## 5 Flow measurements in tunnel

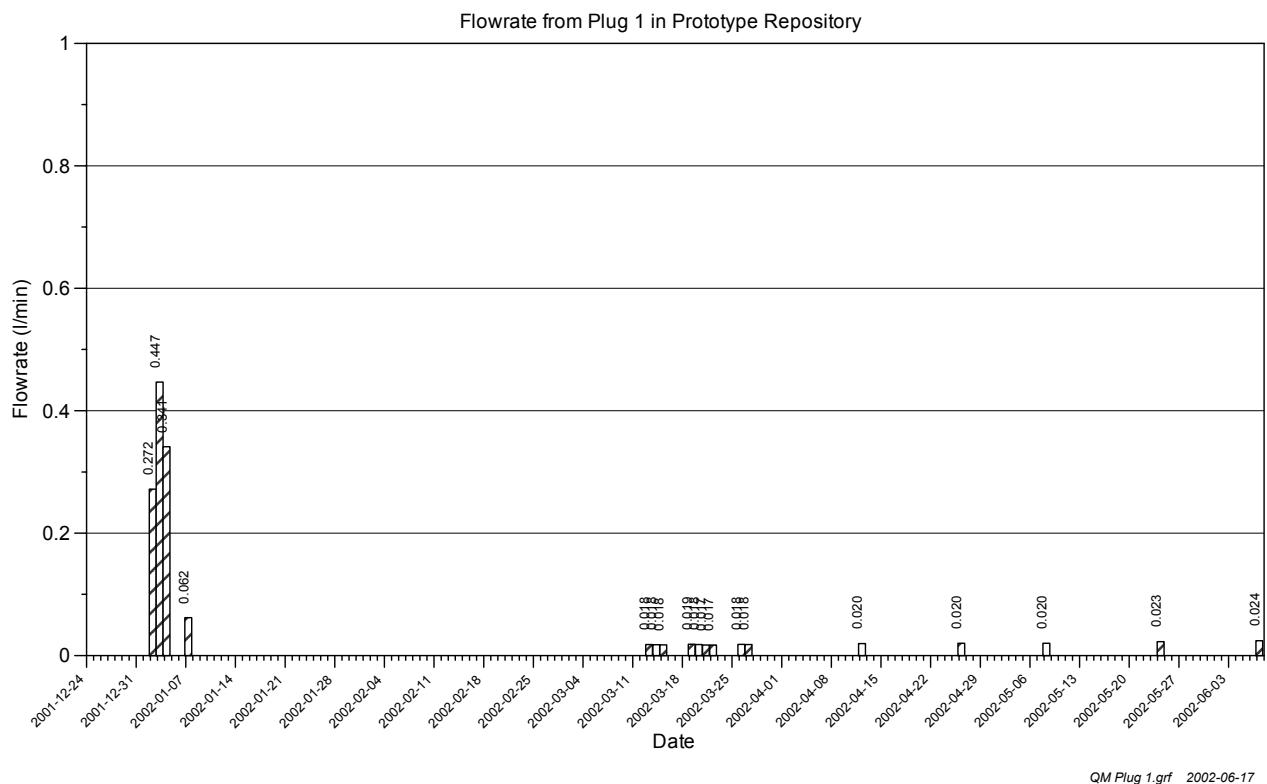

### 5.1 Tunnel A

The purpose of the flow measurements in the tunnel A is to get an estimate of the leakage amount from Section I via any leakage pathways between Plug 1 and the rock itself. Also measured is the amount of leakage into the rock-cut Slit 2 in the position of the future Plug 2.

#### 5.1.1 Flow measurements – Plug 1

The casting of Plug 1 was finalised 2001-12-19. The flowrates were measured during two periods, 2001-12-27 to 2002-01-07 and 2002-03-12 to 2002-03-26. The flowrate was measured with a flowmeter mounted on the hose from the pump.

In Figure 5-1 and Table 5-1 the flowrates are illustrated.

**Figure 5-1.** Flowrate from Plug 1 (collected by a weir-dam 1 m from the plug at the tunnelfloor).

**Table 5-1 Flow measurement - Plug 1**

Start Date	Start Time	Stop Date	Stop Time	Volume (l)	Flowrate (l/min)	Flow (m <sup>3</sup> /s)
2001-12-27	07:42	2002-01-02	07:55	2352	0.272	4.5E-06
2002-01-02	07:55	2002-01-03	07:34	634	0.447	7.4E-06

2002-03-21	07:35	2002-03-22	07:50	24.9	0.017	2.9E-07
2002-03-25	07:20	2002-03-26	07:35	26.7	0.018	3.1E-07
2002-03-26	07:35	2002-03-27	07:35	26	0.018	3.0E-07
2002-04-11	07:30	2002-04-12	07:40	28.3	0.020	3.3E-07
2002-04-25	07:55	2002-04-26	07:35	28.7	0.020	3.4E-07
2002-05-07	08:00	2002-05-08	07:25	28.4	0.020	3.4E-07
2002-05-23	07:25	2002-05-24	10:15	36.6	0.023	3.8E-07
2002-06-06	07:35	2002-06-07	07:50	35.6	0.024	4.1E-07
2002-07-29	10:05	2002-07-30	10:05	33.9	0.024	3.9E-07
2002-08-15	07:50	2002-08-16	07:46	32.2	0.022	3.7E-07
2002-08-29	07:30	2002-08-30	07:23	31.6	0.022	3.7E-07

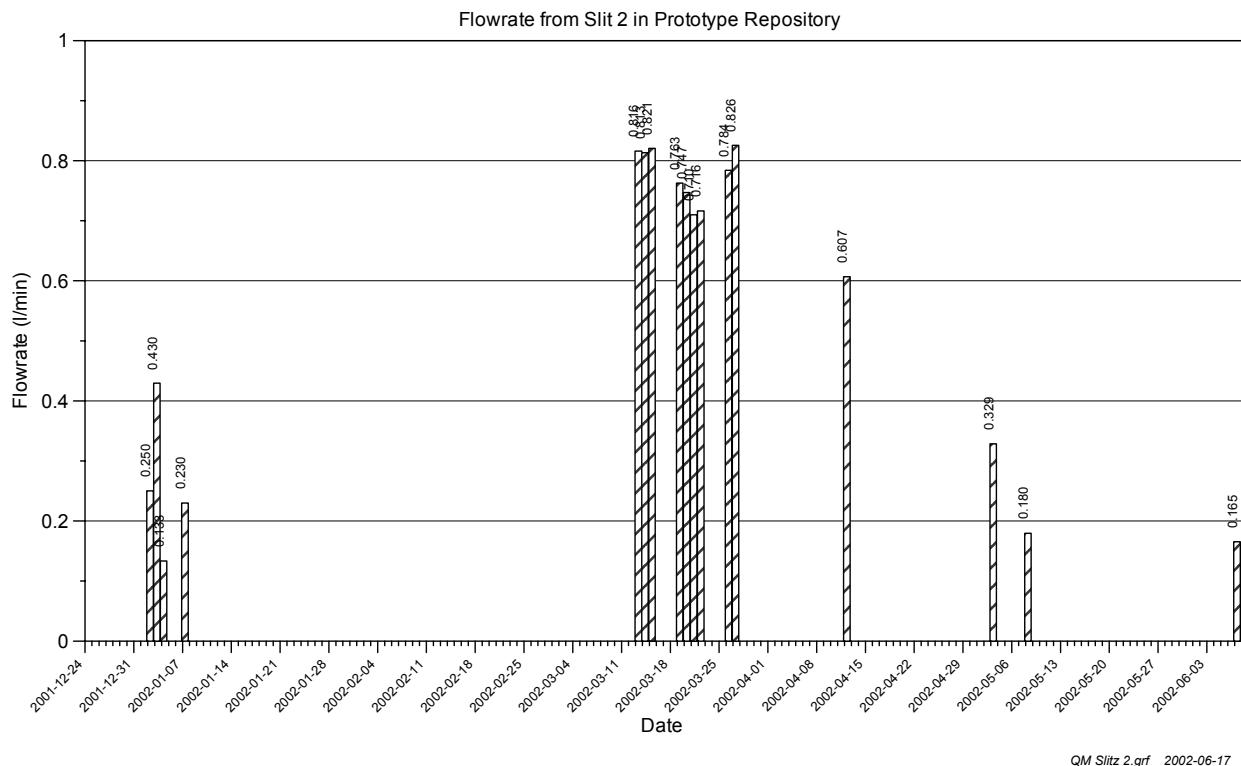

Grouting was done at the plug 2002-01-28 and 2002-01-29. As observed above the leaking rate has decreased from January 2002 to the end of March 2002.

### 5.1.2 Flow measurements – Slit 2

Slit 2 is in the position of tunnel A where later Plug 2 was casted.

The flowrates were measured during two periods, 2001-12-27 to 2002-01-07 and 2002-03-12 to 2002-03-26. The flowrate was measured with a flowmeter mounted on the hose from the pump.

In Figure 5-2 and Table 5-2 the flowrates are illustrated.

**Figure 5-2.** Flowrate from Slit 2

**Table 5-2 Flow measurements- Slit 2**

Start Date	Start Time	Stop Date	Stop Time	Volume (l)	Flowrate (l/min)	Flow (m <sup>3</sup> /s)
2001-12-27	15:03	2002-01-02	07:55	2056	0.250	4.2E-06
2002-01-02	07:55	2002-01-03	07:35	610	0.430	7.2E-06
2002-01-03	07:35	2002-01-04	06:34	184	0.133	2.2E-06
2002-01-04	06:34	2002-01-07	08:08	1015	0.230	3.8E-06
2002-03-12	11:00	2002-03-13	10:00	1126	0.816	1.4E-05
2002-03-13	10:00	2002-03-14	08:20	1090	0.813	1.4E-05

2002-03-18	07:20	2002-03-19	08:15	1140	0.763	1.3E-05
2002-03-19	08:15	2002-03-20	08:10	1072	0.747	1.2E-05
2002-03-20	08:10	2002-03-21	08:15	1026	0.710	1.2E-05
2002-03-21	08:15	2002-03-22	08:55	1060	0.716	1.2E-05
2002-03-25	07:20	2002-03-26	08:20	1176	0.784	1.3E-05
2002-03-26	08:20	2002-03-27	08:30	1197	0.826	1.4E-05
2002-04-11	07:50	2002-04-12	08:00	880	0.607	1.0E-05
2002-05-02	08:10	2002-05-03	08:00	470	0.329	5.5E-06
2002-05-07	08:00	2002-05-08	07:40	255	0.180	3.0E-06
2002-06-06	08:38	2002-06-07	07:50	230	0.165	2.8E-06
2002-07-29	11:55	2002-07-30	10:00	182	0.137	2.3E-06
2002-08-15	08:15	2002-08-16	08:18	458	0.317	5.3E-06
2002-08-29	08:05	2002-08-30	08:03	265	0.184	3.1E-06

As can be noticed the flowrate into Slit 2 has increased during the period January – March 2002. The flowrates measured in January 2002 are however considered as very uncertain while the rates measured in March are more accurate.

### 5.1.3 Flow measurements downstream of Plug 2

The casting of Plug 2 was finalised 2003-09-11. Construction of the three weirs downstream of the plug were done during the autumn of 2003. The freezing of the plug started 2004-09-20 and the final grouting of the plug was done 2004-10-06 to 10-08.

Flow measurements in the weirs were done manually twice only 2003-12-12 and 2003-12-17, see Table 5-3. Manual measurements done in December 2003 show a flowrate for MA3515G of 0.175 – 0.19 L/min, for MA3525G of 1.15 – 1.25 L/min and for MA3535G of 0.38 – 0.45 L/min.

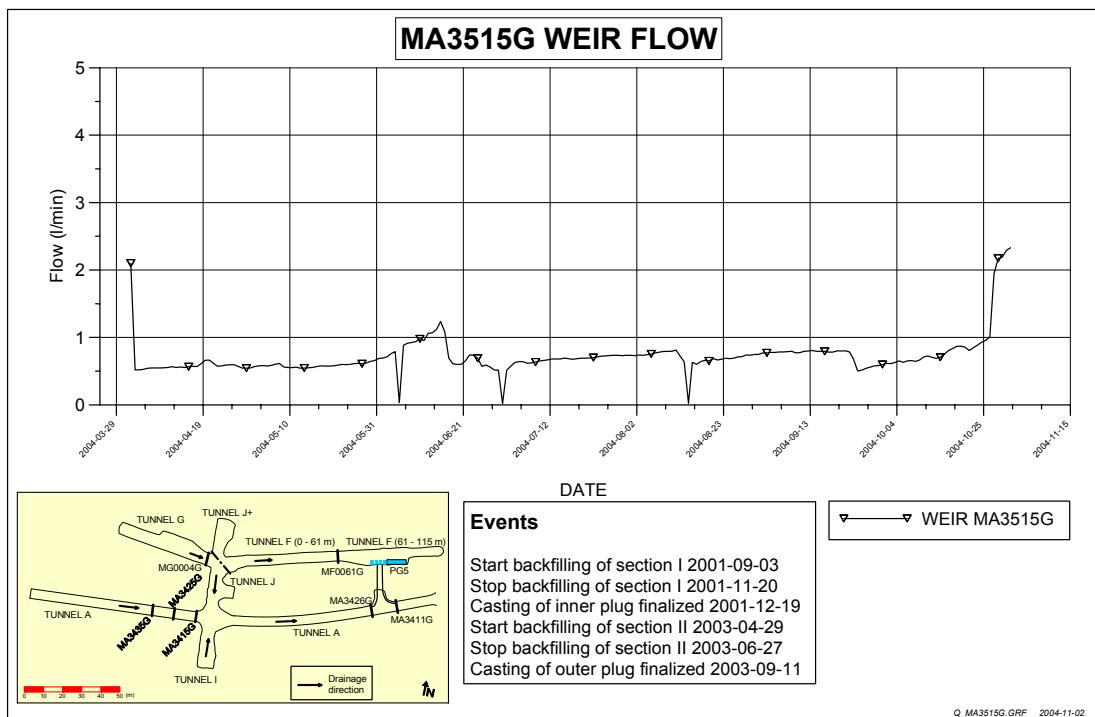

**Table 5-3 First measurements in MA3515G, MA3525G and MA3535G**

Weir	Q (L/min) : 20031212	Q (L/min) : 20031217
MA3515G	0.90	0.76
MA3525G	1.15	0.75
MA3535G	0.175	0.19

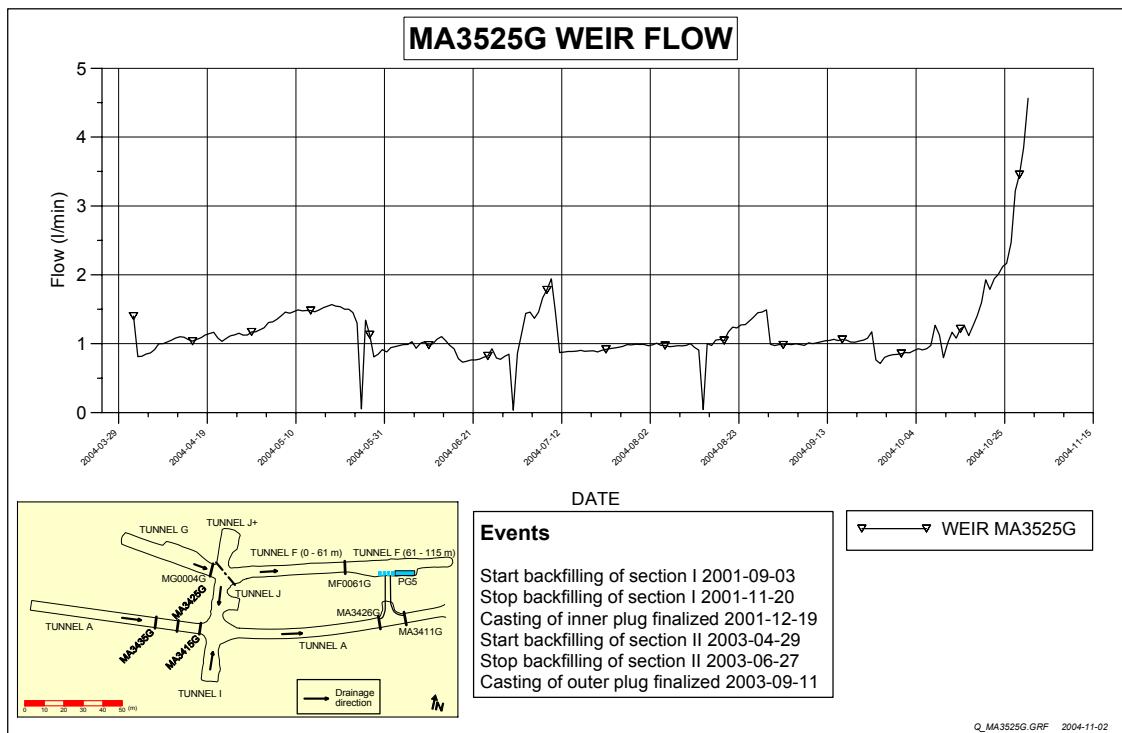

The increase of flow during October 2004 was caused by yet unknown causes, but it is believed that the final grouting that was done around Plug 2 October 8, 2004 is the cause to it. The flowrates have now decreased once again (January 2005).

In April 2004 the flow measurements were connected to HMS and automatical measurements proceeds since then.

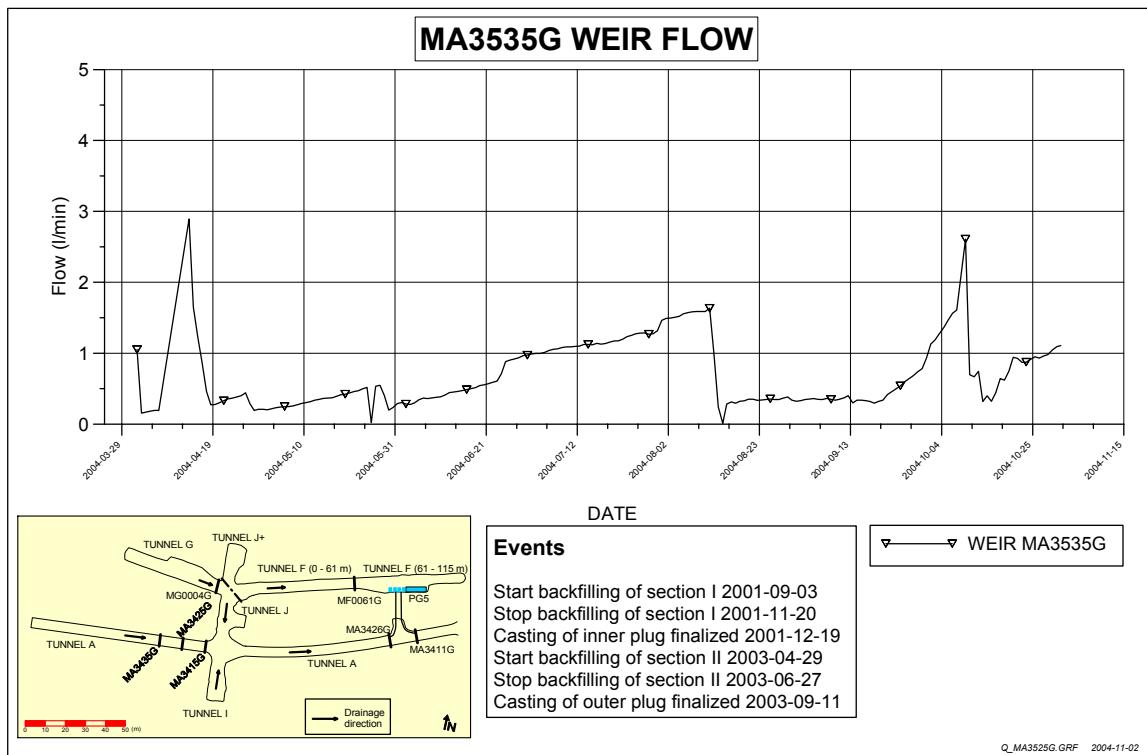

An updated plot (2004-10-31) of each weir is shown in Figures 5-3 to 5-5.

**Figure 5-3.** Flow in MA3515G

**Figure 5-4.** Flow in MA3525G

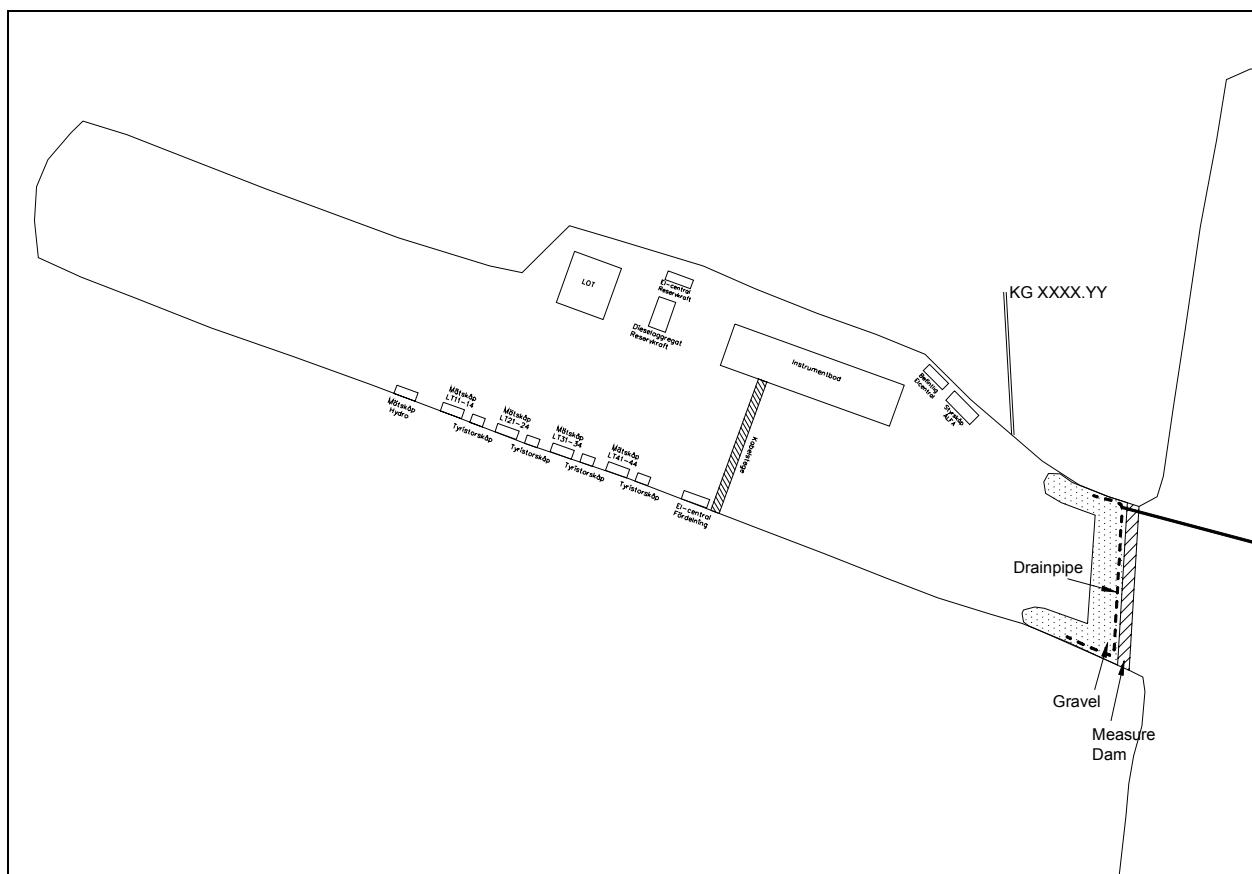

**Figure 5-5.** Flow in MA3535G

## 5.2 Tunnel G

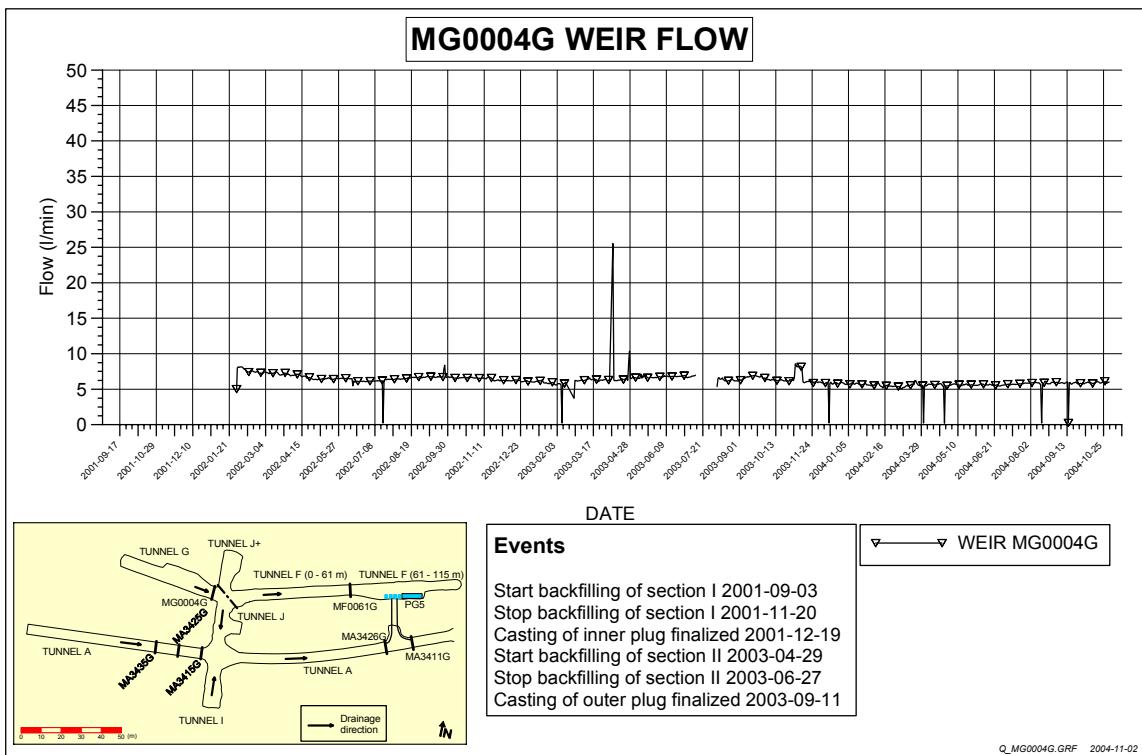

A measurement weir has been constructed 4 meters into the G-tunnel in order to get correct inleakage rates to this part of the tunnel system.

The drainage from Section I in the prototype repository will be continued until Section II is finalized and in operation. Meanwhile the drainage water from the pumps is led through three lead-through holes into the G-tunnel. This water is included in the rate measured at the weir MG0004G. The flowrate was 2002-05-10 measured to be 2.5 L/min.

In (Rhén, Forsmark, 2001), the inflow to the G-tunnel was estimated to be within the interval 5 – 7 L/min. When taken into account the subflow from Section I in the prototype this estimation is still valid.

**Figure 5-6.** Position of the weir MG0004G in Tunnel G, The borehole KGXXXX.YY is KG0010B01 (a borehole for testing HM equipment).

**Figure 5-7, Flow in MG0004G (Flow from Section I is included)**

## 6 Grouting close to Prototype Repository

Grouting has been done in the tunnelsystem ever since construction due to various reasons. These main grouting activities has been identified

- PregROUTing grouting during construction
- Supplementary grouting after construction
- Grouting of lead-through holes between G and A tunnel
- Grouting around plug 1
- Grouting around plug 2
- Various grouting activities in G, I, J and A tunnel section 3500 – 3600 m where the main known activity is the grouting of KA3510A, 0 – 50 m, (Forsmark, Rhén, 2000).

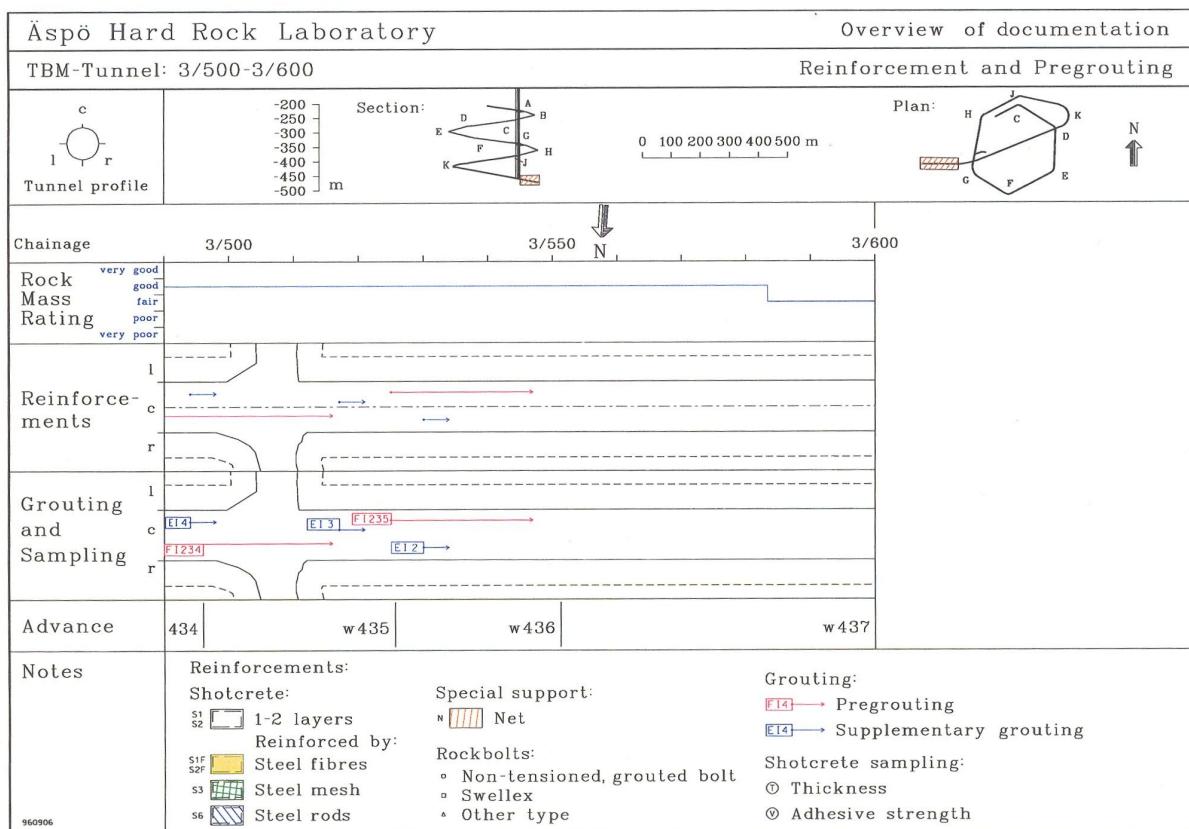

### 6.1 PregROUTing grouting during construction

Grouting was done during construction from the TBM machine in August 1994. In Table 6-1 below the recorded data is shown. The surplus of grout column gives an indication of how effective the actual grouting was, i.e. how much grout entered the fracture system connected to the borehole.

**Table 6-1 Data of pregrouting activities during construction**

PregROUTing round	Tunnel chainage (m)	Number of holes	Length of holes (m)	Volume of holes (L)	Volume of injected cement / agent (L)	Surplus of grout (%)
FI 234	3481	4	140 (4 x 35)	345	1045?	203
FI 235	3526	4	88 (4 x 22)	217	1211?	458

In Figure 6-1 an overview of pregrouting and supplementary reinforcement activities are shown.

**Figure 6-1.** Overview of reinforcement activities during construction and supplementary grouting

## 6.2 Supplementary grouting after construction

Supplementary grouting was done in April 1995. In Table 6-2 below the recorded data is shown. The surplus of grout column gives an indication of how effective the actual grouting was, i.e. how much grout entered the fracture system connected to the borehole.

**Table 6-2 Data of supplementary grouting activities after construction**

Supplementary grouting round	Tunnel chainage (m)	Number of holes	Length of holes (m)	Volume of holes (L)	Volume of injected cement / agent (L)	Surplus of grout (%)
EI 2	3530	3	12 (3 x 4)	29	240	728
EI 3	3517	4	16 (4 x 4)	39	588	1408

### 6.3 Grouting of lead-through holes between G and A tunnel

Grouting was made in the lead-through holes between the G-tunnel and the prototype tunnel. The intention was to close possible hydraulic short-cuts without injecting too much grout into the rockmass (maximum 15% of theoretical volume between borehole wall and cable lead-through casing). In Table 6-3 the recorded data is shown. The surplus of grout column gives an indication of how effective the actual grouting was, i.e. how much grout entered the fracture system connected to the borehole.

**Table 6-3 Grouting of lead-through holes**

Borehole	Hole length (m)	Water flow before grouting (L/min)	Theoretical volume (L)	Total grout volume (L)	Surplus of grout (L)	Surplus of grout (%)

## 6.4 Grouting around plug 1

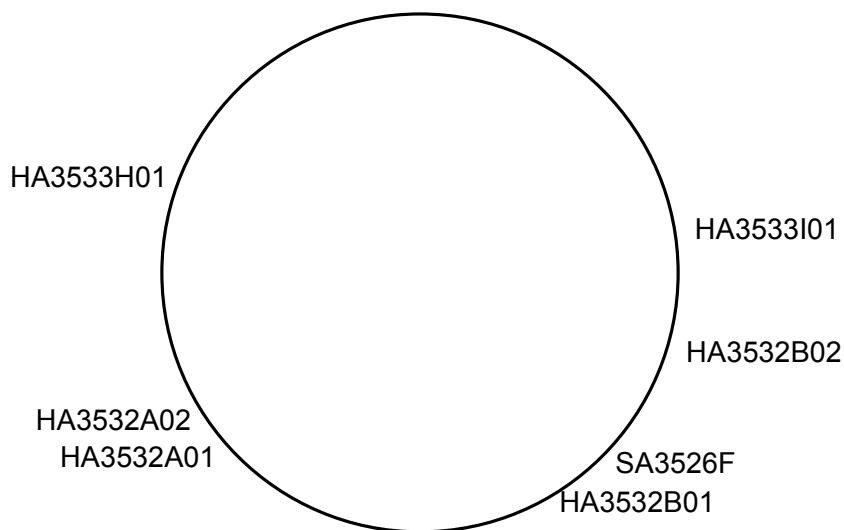

Some minor contact grouting was done January 28 – 29, 2002.

## 6.5 Grouting around plug 2

In order to finally close any short-cuts around plug 2 injection grouting was done October 8, 2004. Some minor contact grouting was done October 8 – 10, 2004.

Seven boreholes were drilled and in Table 6-4 the grout amounts are detailed.

In Figure 6-2 the approximate locations of the grouting boreholes around Plug 2 are shown.

**Figure 6-2.** Grouting boreholes around plug 2 facing westwards in A-tunnel

**Table 6-4 Grouted boreholes near Plug 2 (All boreholes have diameter 57 mm)**

Borehole	Grouted hole length (m)	Water flow before grouting (L/min)	Grouting date	Theoretical hole volume (L)	Grout volume (L)

## **6.6 Various grouting activities in G, I, J and A tunnel section 3500 – 3600 m**

The first 50 meters of borehole KA3510A is grouted since during the drilling of KA3510A in 1996 rather large amounts of water inleakage to the borehole was encountered during the first 47 meters. The accumulated flow was at 47.32 m<sup>3</sup> 62 L/min. It was then decided to grout this the first part of the borehole. This was done at five different occasions with a total injected volume of cement of 1609 litres. After the grouting and redrilling of the borehole the water inflow was 0.64 L/min.

The following boreholes in Table 6-5 have been grouted. The surplus of grout column gives an indication of how effective the actual grouting was, i.e. how much grout entered the fracture system connected to the borehole.

**Table 6-5 Various grouted boreholes near or within the prototype**

Borehole	Grouted hole length (m)	Grouting date	Hole volume (L)	Grout volume (L)	Surplus of grout (%)
KA3510A	50	1996-08-29 – 1996-09-01	227	1609	609
KA3575G07	7.90	2001-05-04	35.8	323	802

# **Appendix 1**

## **Measurement of inflow rates to deposition hole DA3551G01 using diapers**

This appendix includes the details of the diaper measurement of DA3551G01 as described in chapter 4.1 and consists of three parts:

1. Flow measurements using diapers
2. Hydraulic conductivity estimations
3. Statistics of hydraulic conductivity estimations

### **Part 1 Flow measurements using diapers**

<b>Plank</b>	The plank number
<b>Diaper</b>	The diaper number applied downwards
<b>O_length</b>	The "length" following the borehole circumference starting at centreline of the tunnel facing east and running clock-wise
<b>Depth</b>	Centre of each diaper at borehole depth
<b>Date_start</b>	Start of measurement
<b>Weight_start</b>	Weight of diaper at the start of the measurement, grams
<b>Date_end</b>	Stop of measurement
<b>Weight_end</b>	Weight of diaper at the end of the measurement, grams
<b>Weight_diff</b>	Difference in weight between start and stop time, grams
<b>Q_corrected</b>	The calculated flowrate of each area covered by a diaper, m <sup>3</sup> /s, after reducing the weight_diff with the reference value 6 grams.

Plank	Diaper	O_length (m)	Depth (m)	Date_start	Weight_start (g)	Date_end	Weight_end (g)	Weight_diff (g)	Q_corrected (m³/s)	Q_corrected (l/min)

## **Part 2**

## **Hydraulic conductivity estimations**

Abbreviations in Table below

<b>Plank</b>	The plank number
<b>Diaper</b>	The diaper number applied downwards
<b>O_length</b>	The "length" following the borehole circumference starting at centreline of the tunnel facing east and running clock-wise
<b>Depth</b>	Centre of each diaper at borehole depth
<b>Q_corrected</b>	The calculated flowrate of each area covered by a diaper, l/min, after reducing the weight_diff with the reference value 6 grams.
<b>K<sub>max</sub> (d=1.15)</b>	Maximum estimated hydraulic conductivity at a distance of 1.15 meters from deposition borehole centre.
<b>K<sub>med</sub> (d=1.15)</b>	Mean estimated hydraulic conductivity at a distance of 1.15 meters from deposition borehole centre.
<b>K<sub>min</sub> (d=1.15)</b>	Minimum estimated hydraulic conductivity at a distance of 1.15 meters from deposition borehole centre.
<b>K<sub>max</sub> (d=5)</b>	Maximum estimated hydraulic conductivity at a distance of 5 meters from deposition borehole centre.
<b>K<sub>med</sub> (d=5)</b>	Mean estimated hydraulic conductivity at a distance of 5 meters from deposition borehole centre.
<b>K<sub>min</sub> (d=5)</b>	Minimum estimated hydraulic conductivity at a distance of 5 meters from deposition borehole centre.

Plank	Diaper	O_length	Depth	Q_corrected (l/min)	K <sub>max</sub> (d=1.15) (m/s)	K <sub>med</sub> (d=1.15) (m/s)	K <sub>min</sub> (d=1.15) (m/s)	K <sub>max</sub> (d=5) (m/s)	K <sub>med</sub> (d=5) (m/s)	K <sub>min</sub> (d=5) (m/s)

## **Part 3**

## **Statistics of hydraulic conductivity estimations**

This part presents the detailed result of a one-variable analysis of the hydraulic conductivity presented in Part 2 in this appendix. The software used is Statgraphics version 4.0.

Distribution characteristics presented in Chapter 4 is estimated from the dashed line, if it is drawn in the figures below, and from the calculated characteristics otherwise.

## Analysis Summary

```
Data variable: Log_Kmin_1.15_m  
624 values ranging from -13.301 to -11.1938
```

### The StatAdvisor

```
-----  
This procedure is designed to summarize a single sample of data.  
It will calculate various statistics and graphs. Also included in the  
procedure are confidence intervals and hypothesis tests. Use the  
Tabular Options and Graphical Options buttons on the analysis toolbar  
to access these different procedures.
```

### Summary Statistics for Log\_Kmin\_1.15\_m

```
Count = 624  
Average = -13.0107  
Median = -13.301  
Mode = -13.301  
Geometric mean =  
Variance = 0.313352  
Standard deviation = 0.559779  
Standard error = 0.0224091  
Minimum = -13.301  
Maximum = -11.1938  
Range = 2.10721  
Lower quartile = -13.301  
Upper quartile = -13.1397  
Interquartile range = 0.161358  
Skewness = 1.67607  
Stnd. skewness = 17.0926  
Kurtosis = 1.17378  
Stnd. kurtosis = 5.98511  
Coeff. of variation = -4.30245%  
Sum = -8118.68
```

### The StatAdvisor

```
-----  
This table shows summary statistics for Log_Kmin_1.15_m. It  
includes measures of central tendency, measures of variability, and  
measures of shape. Of particular interest here are the standardized  
skewness and standardized kurtosis, which can be used to determine  
whether the sample comes from a normal distribution. Values of these  
statistics outside the range of -2 to +2 indicate significant  
departures from normality, which would tend to invalidate any  
statistical test regarding the standard deviation. In this case, the  
standardized skewness value is not within the range expected for data  
from a normal distribution. The standardized kurtosis value is not  
within the range expected for data from a normal distribution.
```

Percentiles for Log\_Kmin\_1.15\_m

```
1.0% = -13.301
5.0% = -13.301
10.0% = -13.301
25.0% = -13.301
50.0% = -13.301
75.0% = -13.1397
90.0% = -11.8239
95.0% = -11.7212
99.0% = -11.5528
```

The StatAdvisor

This pane shows sample percentiles for Log\_Kmin\_1.15\_m. The percentiles are values below which specific percentages of the data are found. You can see the percentiles graphically by selecting Quantile Plot from the list of Graphical Options.

The StatAdvisor

This option performs a frequency tabulation by dividing the range of Log\_Kmin\_1.15\_m into equal width intervals and counting the number of data values in each interval. The frequencies show the number of data values in each interval, while the relative frequencies show the proportions in each interval. You can change the definition of the intervals by pressing the alternate mouse button and selecting Pane Options. You can see the results of the tabulation graphically by selecting Frequency Histogram from the list of Graphical Options.

### Summary Statistics for Log\_Kmin\_5\_m

```
Count = 624  
Average = -12.9983  
Median = -13.301  
Mode = -13.301  
Geometric mean =  
Variance = 0.333713  
Standard deviation = 0.577679  
Standard error = 0.0231257  
Minimum = -13.301  
Maximum = -11.1427  
Range = 2.15836  
Lower quartile = -13.301  
Upper quartile = -13.0915  
Interquartile range = 0.209515  
Skewness = 1.65091  
Stnd. skewness = 16.836  
Kurtosis = 1.0917  
Stnd. kurtosis = 5.56662  
Coeff. of variation = -4.44427%  
Sum = -8110.93
```

### The StatAdvisor

```
-----  
This table shows summary statistics for Log_Kmin_5_m. It includes  
measures of central tendency, measures of variability, and measures of  
shape. Of particular interest here are the standardized skewness and  
standardized kurtosis, which can be used to determine whether the  
sample comes from a normal distribution. Values of these statistics  
outside the range of -2 to +2 indicate significant departures from  
normality, which would tend to invalidate any statistical test  
regarding the standard deviation. In this case, the standardized  
skewness value is not within the range expected for data from a normal  
distribution. The standardized kurtosis value is not within the range  
expected for data from a normal distribution.

The StatAdvisor

-----  
This option performs a frequency tabulation by dividing the range of Log\_Kmin\_5\_m into equal width intervals and counting the number of data values in each interval. The frequencies show the number of data values in each interval, while the relative frequencies show the proportions in each interval. You can change the definition of the intervals by pressing the alternate mouse button and selecting Pane Options. You can see the results of the tabulation graphically by selecting Frequency Histogram from the list of Graphical Options.

## **Appendix 2**

### **Measurement of inflow rates to deposition hole DA3545G01 using diapers**

This appendix includes the details of the diaper measurement of DA3545G01 as described in chapter 4.2 and consists of three parts:

1. Flow measurements using diapers
2. Hydraulic conductivity estimations
3. Statistics of hydraulic conductivity estimations

#### **Part 1                    Flow measurements using diapers**

<b>Plank</b>	The plank number
<b>Diaper</b>	The diaper number applied downwards
<b>O_length</b>	The "length" following the borehole circumference starting at centreline of the tunnel facing east and running clock-wise
<b>Depth</b>	Centre of each diaper at borehole depth
<b>Date_start</b>	Start of measurement
<b>Weight_start</b>	Weight of diaper at the start of the measurement, grams
<b>Date_end</b>	Stop of measurement
<b>Weight_end</b>	Weight of diaper at the end of the measurement, grams
<b>Weight_diff</b>	Difference in weight between start and stop time, grams
<b>Q_corrected</b>	The calculated flowrate of each area covered by a diaper, $\text{m}^3/\text{s}$ , after reducing the weight_diff with the reference value 6 grams.

Plank	Diaper	O_length (m)	Depth (m)	Date_start	Weight_start (g)	Date_end	Weight_end (g)	Weight_diff (g)	Q_corrected (m³/s)	Q_corrected (l/min)

## **Part 2**

## **Hydraulic conductivity estimations**

Abbreviations in Table below

<b>Plank</b>	The plank number
<b>Diaper</b>	The diaper number applied downwards
<b>O_length</b>	The "length" following the borehole circumference starting at centreline of the tunnel facing east and running clock-wise
<b>Depth</b>	Centre of each diaper at borehole depth
<b>Q_corrected</b>	The calculated flowrate of each area covered by a diaper, l/min, after reducing the weight_diff with the reference value 6 grams.
<b>K<sub>max</sub> (d=1.15)</b>	Maximum estimated hydraulic conductivity at a distance of 1.15 meters from deposition borehole centre.
<b>K<sub>med</sub> (d=1.15)</b>	Mean estimated hydraulic conductivity at a distance of 1.15 meters from deposition borehole centre.
<b>K<sub>min</sub> (d=1.15)</b>	Minimum estimated hydraulic conductivity at a distance of 1.15 meters from deposition borehole centre.
<b>K<sub>max</sub> (d=5)</b>	Maximum estimated hydraulic conductivity at a distance of 5 meters from deposition borehole centre.
<b>K<sub>med</sub> (d=5)</b>	Mean estimated hydraulic conductivity at a distance of 5 meters from deposition borehole centre.
<b>K<sub>min</sub> (d=5)</b>	Minimum estimated hydraulic conductivity at a distance of 5 meters from deposition borehole centre.

## **Part 3**

## **Statistics of hydraulic conductivity estimations**

This part presents the detailed result of a one-variable analysis of the hydraulic conductivity presented in Part 2 in this appendix. The software used is Statgraphics version 4.0.

Distribution characteristics presented in Chapter 4 is estimated from the dashed line, if it is drawn in the figures below, and from the calculated characteristics otherwise.

## Analysis Summary

```
Data variable: Log_Kmin_1.15_m  
624 values ranging from -13.301 to -11.4815
```

### The StatAdvisor

```
-----  
This procedure is designed to summarize a single sample of data.  
It will calculate various statistics and graphs. Also included in the  
procedure are confidence intervals and hypothesis tests. Use the  
Tabular Options and Graphical Options buttons on the analysis toolbar  
to access these different procedures.
```

### Summary Statistics for Log\_Kmin\_1.15\_m

```
Count = 624  
Average = -12.7693  
Median = -13.301  
Mode = -13.301  
Geometric mean =  
Variance = 0.463095  
Standard deviation = 0.680511  
Standard error = 0.0272422  
Minimum = -13.301  
Maximum = -11.4815  
Range = 1.81954  
Lower quartile = -13.301  
Upper quartile = -12.0177  
Interquartile range = 1.2833  
Skewness = 0.721297  
Stnd. skewness = 7.35582  
Kurtosis = -1.24963  
Stnd. kurtosis = -6.37189  
Coeff. of variation = -5.32925%  
Sum = -7968.07
```

### The StatAdvisor

```
-----  
This table shows summary statistics for Log_Kmin_1.15_m. It  
includes measures of central tendency, measures of variability, and  
measures of shape. Of particular interest here are the standardized  
skewness and standardized kurtosis, which can be used to determine  
whether the sample comes from a normal distribution. Values of these  
statistics outside the range of -2 to +2 indicate significant  
departures from normality, which would tend to invalidate any  
statistical test regarding the standard deviation. In this case, the  
standardized skewness value is not within the range expected for data  
from a normal distribution. The standardized kurtosis value is not  
within the range expected for data from a normal distribution.
```

Percentiles for Log\_Kmin\_1.15\_m

```
1.0% = -13.301
5.0% = -13.301
10.0% = -13.301
25.0% = -13.301
50.0% = -13.301
75.0% = -12.0177
90.0% = -11.6778
95.0% = -11.6198
99.0% = -11.5229
```

The StatAdvisor

This pane shows sample percentiles for Log\_Kmin\_1.15\_m. The percentiles are values below which specific percentages of the data are found. You can see the percentiles graphically by selecting Quantile Plot from the list of Graphical Options.

Frequency Tabulation for Log\_Kmin\_1.15\_m

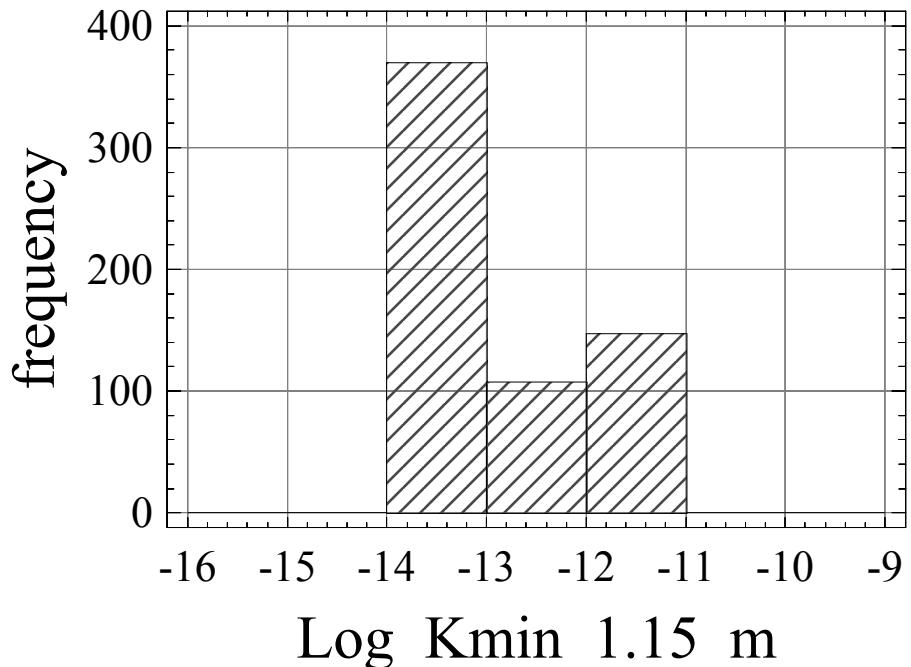

Class	Lower Limit	Upper Limit	Midpoint	Frequency	Relative Frequency	Cumulative Frequency	Cum. Rel. Frequency

The StatAdvisor

This option performs a frequency tabulation by dividing the range of Log\_Kmin\_1.15\_m into equal width intervals and counting the number of data values in each interval. The frequencies show the number of data values in each interval, while the relative frequencies show the proportions in each interval. You can change the definition of the intervals by pressing the alternate mouse button and selecting Pane Options. Histogram for Log\_Kmin\_1.15\_m

Normal Probability Plot for Log\_Kmin\_1.15\_m

## Analysis Summary

```
Data variable: Log_Kmean_1.15_m  
624 values ranging from -13.301 to -10.8539
```

### The StatAdvisor

```
-----  
This procedure is designed to summarize a single sample of data.  
It will calculate various statistics and graphs. Also included in the  
procedure are confidence intervals and hypothesis tests. Use the  
Tabular Options and Graphical Options buttons on the analysis toolbar  
to access these different procedures.
```

### Summary Statistics for Log\_Kmean\_1.15\_m

```
Count = 624  
Average = -12.4138  
Median = -12.7959  
Mode = -13.301  
Geometric mean =  
Variance = 0.856269  
Standard deviation = 0.925348  
Standard error = 0.0370436  
Minimum = -13.301  
Maximum = -10.8539  
Range = 2.44716  
Lower quartile = -13.301  
Upper quartile = -11.3768  
Interquartile range = 1.92428  
Skewness = 0.455274  
Stnd. skewness = 4.6429  
Kurtosis = -1.47882  
Stnd. kurtosis = -7.54056  
Coeff. of variation = -7.45421%  
Sum = -7746.19
```

### The StatAdvisor

```
-----  
This table shows summary statistics for Log_Kmean_1.15_m. It  
includes measures of central tendency, measures of variability, and  
measures of shape. Of particular interest here are the standardized  
skewness and standardized kurtosis, which can be used to determine  
whether the sample comes from a normal distribution. Values of these  
statistics outside the range of -2 to +2 indicate significant  
departures from normality, which would tend to invalidate any  
statistical test regarding the standard deviation. In this case, the  
standardized skewness value is not within the range expected for data  
from a normal distribution. The standardized kurtosis value is not  
within the range expected for data from a normal distribution.
```

Percentiles for Log\_Kmean\_1.15\_m

```
1.0% = -13.301
5.0% = -13.301
10.0% = -13.301
25.0% = -13.301
50.0% = -12.7959
75.0% = -11.3768
90.0% = -11.0458
95.0% = -10.9586
99.0% = -10.8861
```
